Exercise 5.2.

For the PDA below, trace every possible sequence of moves for the two input strings *aba* and *aab*.

Example 5.7. A Pushdown Automaton Accepting Pal

$$\mathsf{Pal} = \{ y \in \{a, b\}^* \mid y = y^r \} = \{ xx^r, xax^r, xbx^r \mid x \in \{a, b\}^* \}$$

1

Exercise 5.4.

For each of the following languages over $\{a, b\}^*$, modify the PDA below to obtain a PDA accepting the language.

- a. The language of even-length palindromes.
- **b.** The language of odd-length palindromes.

Example 5.7. A Pushdown Automaton Accepting Pal

$$Pal = \{y \in \{a, b\}^* \mid y = y^r\} = \{xx^r, xax^r, xbx^r \mid x \in \{a, b\}^*\}$$

$$a, +a \qquad a, a/\Lambda$$

$$b, +b \qquad b, b/\Lambda$$

$$q_0 \qquad A \qquad q_1 \qquad A, Z_0/Z_0$$

$$q_2$$

Exercise 5.5.

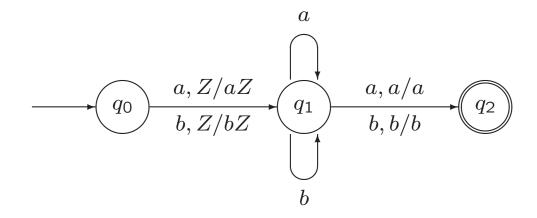

Give transition diagrams for PDAs accepting each of the following languages.

a. The language of all odd-length strings over $\{a, b\}$ with middle symbol a.

- **b.** $\{a^n x \mid n \ge 0, x \in \{a, b\}^* \text{ and } |x| \le n\}.$
- **c.** $\{a^i b^j c^k \mid i, j, k \ge 0 \text{ and } j = i \text{ or } j = k\}.$

Exercise 5.6.

Below, a transition diagram is given for a PDA with initial state q_0 and accepting state q_2 . Describe the language that is accepted.

Exercise.

Let
$$L_1 = \{a^i b^j c^k \mid i, j, k \ge 0 \text{ en } 2i > j\}.$$

a. Give the first five elements of L_1 in the canonical order.

b. Give a PDA M_1 such that $L(M_1) = L_1$.

Exercise.

Let
$$L_1 = \{a^i b^j c^k \mid i, j, k \ge 0 \text{ en } 2i > j\}.$$

a. Give the first five elements of L_1 in the canonical order.

b. Give a DPDA M_1 such that $L(M_1) = L_1$.

Exercise 5.10.

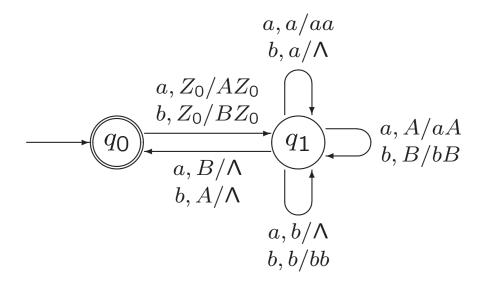

Show that every regular language can be accepted by a (deterministic) PDA M with only two states in which there are no Λ -transitions and no symbols are ever removed from the stack.

Exercise 5.12.

Show that if L is accepted by a PDA in which no symbols are ever removed from the stack, then L is regular.

From lecture 10:

A DPDA for AEqB:

Exercise 5.18.

For each of the following languages, give a transition diagram for a deterministic PDA that accepts that language.

a.
$$\{x \in \{a, b\}^* \mid n_a(x) < n_b(x)\}$$

b.
$$\{x \in \{a, b\}^* \mid n_a(x) \neq n_b(x)\}$$

c.
$$\{x \in \{a, b\}^* \mid n_a(x) = 2n_b(x)\}$$

d. $\{a^n b^{n+m} a^m \mid n, m \ge 0\}$

Exercise 5.16.

Show that if L is accepted by a PDA, then L is accepted by a PDA that never crashes (i.e., for which the stack never empties and no configuration is reached from which there is no move defined).

From lecture 10:

Stack in PDA contains symbols from certain alphabet.

Usual stack operations: pop, top, push

Extra possiblity: replace top element X by string α

$$\begin{array}{ll} \alpha \equiv \Lambda & \text{pop} \\ \alpha \equiv X & \text{top} \\ \alpha \equiv YX & \text{push} \\ \alpha \equiv \beta X & \text{push}^* \\ \alpha \equiv \dots \end{array}$$

Top element X is required to do a move!

Exercise 5.17.

Show that if L is accepted by a PDA, then L is accepted by a PDA in which every move

* either pops something from the stack (i.e., removes a stack symbol without putting anything else on the stack);

* or pushes a single symbol onto the stack on top of the symbol that was previously on top;

* or leaves the stack unchanged.

Hence, each action on the stack due to a move in the PDA has one of the following forms:

```
* either X/\Lambda (with X \in \Gamma),
```

- * or X/YX (with $X, Y \in \Gamma$),
- * or X/X (with $X \in \Gamma$).
