10. Computable Functions

10.2. Quantification, Minimalization, and  $\mu$ -Recursive  
Functions

10.3. Gödel Numbering

A slide from lecture 12:

### Definition 10.1. Initial Functions

The initial functions are the following:

1. *Constant* functions: For each  $k \geq 0$  and each  $a \geq 0$ , the constant function  $C_a^k : \mathbb{N}^k \rightarrow \mathbb{N}$  is defined by the formula

$$C_a^k(X) = a \quad \text{for every } X \in \mathbb{N}^k$$

2. The *successor* function  $s : \mathbb{N} \rightarrow \mathbb{N}$  is defined by the formula

$$s(x) = x + 1$$

3. *Projection* functions: For each  $k \geq 1$  and each  $i$  with  $1 \leq i \leq k$ , the projection function  $p_i^k : \mathbb{N}^k \rightarrow \mathbb{N}$  is defined by the formula

$$p_i^k(x_1, x_2, \dots, x_k) = x_i$$

A slide from lecture 12:

**Definition 10.2.** The Operations of Composition and Primitive Recursion

1. Suppose  $f$  is a partial function from  $\mathbb{N}^k$  to  $\mathbb{N}$ , and for each  $i$  with  $1 \leq i \leq k$ ,  $g_i$  is a partial function from  $\mathbb{N}^m$  to  $\mathbb{N}$ .

The partial function obtained from  $f$  and  $g_1, g_2, \dots, g_k$  by composition is the partial function  $h$  from  $\mathbb{N}^m$  to  $\mathbb{N}$  defined by the formula

$$h(X) = f(g_1(X), g_2(X), \dots, g_k(X)) \text{ for every } X \in \mathbb{N}^m$$

A slide from lecture 12:

**Definition 10.2.** The Operations of Composition and Primitive Recursion (continued)

2. Suppose  $n \geq 0$  and  $g$  and  $h$  are functions of  $n$  and  $n + 2$  variables, respectively. (By “a function of 0 variables,” we mean simply a constant.)

The function obtained from  $g$  and  $h$  by the operation of *primitive recursion* is the function  $f : \mathbb{N}^{n+1} \rightarrow \mathbb{N}$  defined by the formulas

$$\begin{aligned} f(X, 0) &= g(X) \\ f(X, k + 1) &= h(X, k, f(X, k)) \end{aligned}$$

for every  $X \in \mathbb{N}^n$  and every  $k \geq 0$ .

A slide from lecture 12:

**Theorem 10.4.**

Every primitive recursive function is total and computable.

*PR*:  
total and computable

Turing-computable functions:  
not necessarily total

A slide from lecture 12:

*n*-place predicate  $P$  is function from  $\mathbb{N}^n$  to  $\{\text{true}, \text{false}\}$

characteristic function  $\chi_P$  defined by

$$\chi_P(X) = \begin{cases} 1 & \text{if } P(X) \text{ is true} \\ 0 & \text{if } P(X) \text{ is false} \end{cases}$$

We say  $P$  is primitive recursive. . .

## 10.2. Quantification, Minimalization, and $\mu$ -Recursive Functions

A slide from lecture 13:

**Definition 10.11.** Bounded Minimalization

For an  $(n + 1)$ -place predicate  $P$ , the *bounded minimalization* of  $P$  is the function  $m_P : \mathbb{N}^{n+1} \rightarrow \mathbb{N}$  defined by

$$m_P(X, k) = \begin{cases} \min\{y \mid 0 \leq y \leq k \text{ and } P(X, y)\} & \text{if this set is not empty} \\ k + 1 & \text{otherwise} \end{cases}$$

The symbol  $\mu$  is often used for the minimalization operator, and we sometimes write

$$m_P(X, k) = \overset{k}{\mu} y [P(X, y)]$$

An important special case is that in which  $P(X, y)$  is  $(f(X, y) = 0)$ , for some  $f : \mathbb{N}^{n+1} \rightarrow \mathbb{N}$ . In this case  $m_P$  is written  $m_f$  and referred to as the bounded minimalization of  $f$ .

A slide from lecture 13:

**Theorem 10.12.**

If  $P$  is a primitive recursive  $(n + 1)$ -place predicate, its bounded minimalization  $m_P$  is a primitive recursive function.

**Proof...**

A slide from lecture 13:

**Example 10.13.** The  $n$ th Prime Number

$$\text{PrNo}(0) = 2$$

$$\text{PrNo}(1) = 3$$

$$\text{PrNo}(2) = 5$$

$$\text{Prime}(n) = (n \geq 2) \wedge \neg(\text{there exists } y \text{ such that } y \geq 2 \wedge y \leq n - 1 \wedge \text{Mod}(n, y) = 0)$$

A slide from lecture 13:

**Example 10.13.** The  $n$ th Prime Number

Let

$$P(x, y) = (y > x \wedge \text{Prime}(y))$$

Then

$$\text{PrNo}(0) = 2$$

$$\text{PrNo}(k + 1) = m_P(\text{PrNo}(k), (\text{PrNo}(k))! + 1)$$

is primitive recursive, with  $h(x_1, x_2) = \dots$

A slide from lecture 12:

**Theorem 10.4.**

Every primitive recursive function is total and computable.

*PR*:  
total and computable

Turing-computable functions:  
not necessarily total

## **Unbounded minimalization**

Total?

## Unbounded minimalization

Total?

A possible definition:

$$M(X) = \begin{cases} (\min\{y \mid P(X, y) \text{ is true}\}) + 1 & \text{if this set is not empty} \\ 0 & \text{otherwise} \end{cases}$$

Computable?

A slide from lecture 13:

## Unbounded quantification

$$Sq(x, y) = (y^2 = x)$$

$$H(x, y) = T_u \text{ stopt na precies } y \text{ stappen voor invoer } s_x$$

### **Definition 10.14.** Unbounded Minimalization

If  $P$  is an  $(n + 1)$ -place predicate, the *unbounded minimalization* of  $P$  is the **partial** function  $M_P : \mathbb{N}^n \rightarrow \mathbb{N}$  defined by

$$M_P(X) = \min\{y \mid P(X, y) \text{ is true}\}$$

$M_P(X)$  is undefined at any  $X \in \mathbb{N}^n$  for which there is no  $y$  satisfying  $P(X, y)$ .

### **Definition 10.14.** Unbounded Minimalization

If  $P$  is an  $(n + 1)$ -place predicate, the *unbounded minimalization* of  $P$  is the **partial** function  $M_P : \mathbb{N}^n \rightarrow \mathbb{N}$  defined by

$$M_P(X) = \min\{y \mid P(X, y) \text{ is true}\}$$

$M_P(X)$  is undefined at any  $X \in \mathbb{N}^n$  for which there is no  $y$  satisfying  $P(X, y)$ .

The notation  $\mu y[P(X, y)]$  is also used for  $M_P(X)$ .

In the special case in which  $P(X, y) = (f(X, y) = 0)$ , we write  $M_P = M_f$  and refer to this function as the unbounded minimalization of  $f$ .

## Definition 10.15. $\mu$ -Recursive Functions

The set  $\mathcal{M}$  of  $\mu$ -recursive, or simply *recursive*, **partial** functions is defined as follows.

1. Every initial function is an element of  $\mathcal{M}$ .
2. Every function obtained from elements of  $\mathcal{M}$  by composition or primitive recursion is an element of  $\mathcal{M}$ .
3. For every  $n \geq 0$  and every **total** function  $f : \mathbb{N}^{n+1} \rightarrow \mathbb{N}$  in  $\mathcal{M}$ , the function  $M_f : \mathbb{N}^n \rightarrow \mathbb{N}$  defined by

$$M_f(X) = \mu y[f(X, y) = 0]$$

is an element of  $\mathcal{M}$ .

## Example.

Let

$$f(x, k) = p_1^2(x, k) - C_1^2(x, k)$$

$M_f(x) \dots$

## Exercise.

- a. Give an example of a non-total function  $f$  and another function  $g$ , such that the composition of  $f$  and  $g$  is total.
  
- b. Can you also find an example of a non-total function  $f$  and another function  $g$ , such that the composition of  $g$  and  $f$  is total?

## **Theorem 10.16.**

All  $\mu$ -recursive partial functions are computable.

**Proof...**

## 10.3. Gödel Numbering

**Definition 10.17.**

The Gödel Number of a Sequence of Natural Numbers

For every  $n \geq 1$  and every finite sequence  $x_0, x_1, \dots, x_{n-1}$  of  $n$  natural numbers, the *Gödel number* of the sequence is the number

$$gn(x_0, x_1, \dots, x_{n-1}) = 2^{x_0} 3^{x_1} 5^{x_2} \dots (PrNo(n-1))^{x_{n-1}}$$

where  $PrNo(i)$  is the  $i$ th prime (Example 10.13).

### Example 10.18.

The Power to Which a Prime is Raised in the Factorization of  $x$

Function *Exponent* :  $\mathbb{N}^2 \rightarrow \mathbb{N}$  defined as follows:

$$\text{Exponent}(i, x) = \begin{cases} \text{the exp. of } \text{PrNo}(i) \text{ in } x\text{'s prime fact.} & \text{if } x > 0 \\ 0 & \text{if } x = 0 \end{cases}$$

## Theorem 10.19.

Suppose that  $g : \mathbb{N}^n \rightarrow \mathbb{N}$  and  $h : \mathbb{N}^{n+2} \rightarrow \mathbb{N}$  are primitive recursive functions, and  $f : \mathbb{N}^{n+1} \rightarrow \mathbb{N}$  is obtained from  $g$  and  $h$  by course-of-values recursion; that is

$$\begin{aligned}f(X, 0) &= g(X) \\f(X, k + 1) &= h(X, k, gn(f(X, 0), \dots, f(X, k)))\end{aligned}$$

Then  $f$  is primitive recursive.

**Proof...**

**Example.**

Fibonacci

$$f(n) = \begin{cases} 0 & \text{if } n = 0 \\ 1 & \text{if } n = 1 \\ f(n-1) + f(n-2) & \text{if } n \geq 2 \end{cases}$$
