8. Recursively Enumerable Languages

8.3. More General Grammars

8.4. Context-Sensitive Languages and The Chomsky Hierarchy

A slide from lecture 6

Definition 8.10. Unrestricted grammars

An unrestricted grammar is a 4-tuple $G = (V, \Sigma, S, P)$, where V and Σ are disjoint sets of variables and terminals, respectively, S is an element of V called the start symbol, and P is a set of productions of the form

$$\alpha \rightarrow \beta$$

where $\alpha, \beta \in (V \cup \Sigma)^*$ and α contains at least one variable.

A slide from lecture 6

Theorem 8.13.

For every unrestricted grammar G , there is a Turing machine T with $L(T) = L(G)$.

Proof.

1. Move past input
2. Simulate derivation in G on the tape of a Turing machine
3. Equal

A slide from lecture 6

Definition 8.16. Context-Sensitive Grammars

A *context-sensitive grammar* (CSG) is an unrestricted grammar in which no production is length-decreasing.

In other words, every production is of the form $\alpha \rightarrow \beta$, where $|\beta| \geq |\alpha|$.

A language is a context-sensitive language (CSL) if it can be generated by a context-sensitive grammar.

A slide from lecture 6

Definition 8.18. Linear-Bounded Automata

A *linear-bounded automaton* (LBA) is a 5-tuple $M = (Q, \Sigma, \Gamma, q_0, \delta)$ that is identical to a nondeterministic Turing machine, with the following exception.

There are two extra tape symbols [and], assumed not to be elements of the tape alphabet Γ .

The initial configuration of M corresponding to input x is $q_0[x]$, with the symbol [in the leftmost square and the symbol] in the first square to the right of x .

During its computation, M is not permitted to replace either of these brackets or to move its tape head to the left of the [or to the right of the].

A slide from lecture 6

Theorem 8.19.

If $L \subseteq \Sigma^*$ is a context-sensitive language, then there is a linear-bounded automaton that accepts L .

Theorem 8.14.

For every Turing machine T with input alphabet Σ , there is an unrestricted grammar G generating the language $L(T) \subseteq \Sigma^*$.

Proof.

1. Generate (every possible) input string for T (two copies), with additional $(\Delta\Delta)$'s and state.
2. Simulate computation of T for this input string as derivation in grammar (on second copy).
3. If T reaches accept state, reconstruct original input string.

A slide from lecture 3

Notation:

description of tape contents: $x\underline{\sigma}y$ or $x\underline{y}$

configuration $xqy = xqy\Delta = xqy\Delta\Delta$

initial configuration corresponding to input x : $q_0\Delta x$

In the third edition of the book, a configuration is denoted as $(q, x\underline{y})$ or $(q, x\underline{\sigma}y)$ instead of xqy or $xq\sigma y$.

This old notation is also allowed for *Fundamentele Informatica 3*.

Theorem 8.14.

For every Turing machine T with input alphabet Σ , there is an unrestricted grammar G generating the language $L(T) \subseteq \Sigma^*$.

Proof.

1. Generate (every possible) input string for T (two copies), with additional $(\Delta\Delta)$'s and state.
2. Simulate computation of T for this input string as derivation in grammar (on second copy).
3. If T reaches accept state, reconstruct original input string.

Ad 2. Move $\delta(p, a) = (q, b, R)$ of T
yields production $p(\sigma_1 a) \rightarrow (\sigma_1 b)q$

Ad 3. Propagate h_a all over the string

$$h_a(\sigma_1 \sigma_2) \rightarrow \sigma_1, \text{ for } \sigma_1 \in \Sigma$$

$$h_a(\Delta \sigma_2) \rightarrow \Lambda$$

Exercise 8.27.

Show that if L is any recursively enumerable language, then L can be generated by a grammar in which the left side of every production is a string of one or more variables.

Theorem 8.20. If $L \subseteq \Sigma^*$ is accepted by a linear-bounded automaton $M = (Q, \Sigma, \Gamma, q_0, \delta)$, then there is a context-sensitive grammar G generating $L - \{\Lambda\}$.

Proof...

Theorem 8.20. If $L \subseteq \Sigma^*$ is accepted by a linear-bounded automaton $M = (Q, \Sigma, \Gamma, q_0, \delta)$, then there is a context-sensitive grammar G generating $L - \{\Lambda\}$.

Proof. Much like proof of Theorem 8.14, except

- consider $h_a(\sigma_1\sigma_2)$ as a single symbol
- no additional $(\Delta\Delta)$'s needed
- incorporate [and] in leftmost/rightmost symbols of string

Exercise 8.31.

In the proof of Theorem 8.30, the CSG productions corresponding to an LBA move of the form $\delta(p, a) = (q, b, R)$ are given.

Give the productions corresponding to the move $\delta(p, a) = (q, b, L)$ and those corresponding to the move $\delta(p, a) = (q, b, S)$.

Exercise 8.32.

Suppose G is a context-sensitive grammar.

In other words, for every production $\alpha \rightarrow \beta$ of G , $|\beta| \geq |\alpha|$.

Show that there is a grammar G' , with $L(G) = L(G')$, in which every production is of the form

$$\gamma A \zeta \rightarrow \gamma X \zeta$$

where A is a variable and γ , ζ , and X are strings of variables and/or terminals, with X not null.

Exercise 8.32.

$$\begin{aligned} S &\rightarrow bA \mid aAA \\ bA &\rightarrow Ab \\ Ab &\rightarrow ab \\ AA &\rightarrow aa \end{aligned}$$

$$L(G) = \dots$$

Exercise 8.32.

$$\begin{aligned} S &\rightarrow X_b A \mid X_a A A \\ X_b A &\rightarrow A X_b \\ A X_b &\rightarrow X_a X_b \\ A A &\rightarrow X_a X_a \\ X_a &\rightarrow a \\ X_b &\rightarrow b \end{aligned}$$

Exercise 8.32.

$$\begin{aligned} S &\rightarrow X_b A \mid X_a A A \\ X_b A &\rightarrow A A \\ A A &\rightarrow A X_b \\ A X_b &\rightarrow X_a X_b \\ A A &\rightarrow X_a X_a \\ X_a &\rightarrow a \\ X_b &\rightarrow b \end{aligned}$$

$$L(G) = \dots$$

Exercise 8.32.

$$\begin{aligned} S &\rightarrow X_b A \mid X_a A A \\ X_b A &\rightarrow X_1 A \\ X_1 A &\rightarrow X_1 X_2 \\ X_1 X_2 &\rightarrow A X_2 \\ A X_2 &\rightarrow A X_b \\ A X_b &\rightarrow X_a X_b \\ A A &\rightarrow X_a X_a \\ X_a &\rightarrow a \\ X_b &\rightarrow b \end{aligned}$$
