1. [1 point] Draw the parse tree of the formula $p \rightarrow((q \wedge \neg \neg p) \vee \neg(q \rightarrow p))$ and list all its subformulas.
2. [2 points] Give a proof by means of natural deduction of the following sequents:
a) $\vdash \mathrm{p} \rightarrow((\mathrm{p} \rightarrow \mathrm{q}) \rightarrow \mathrm{q})$.

b) $\neg \mathrm{p} \vdash \mathrm{p} \rightarrow(\mathrm{p} \rightarrow \mathrm{q})$.

| 1 | $\neg \mathrm{p}$ | premise |
| :--- | :--- | :--- |
| 2 | p | assumption |
| 3 | $\perp$ | $\neg \mathrm{e} 1,2$ |
| 4 | $\mathrm{p} \rightarrow \mathrm{q}$ | $\perp \mathrm{e} 3$ |
| 5 | $\mathrm{p} \rightarrow(\mathrm{p} \rightarrow \mathrm{q})$ | $\rightarrow \mathrm{i} 2-6$ |

c) $(\mathrm{p} \rightarrow \mathrm{q}) \vee(\mathrm{r} \rightarrow \mathrm{q}) \vdash(\mathrm{p} \wedge \mathrm{r}) \rightarrow \mathrm{q}$

| 1 | $(\mathrm{p} \rightarrow \mathrm{q}) \vee(\mathrm{r} \rightarrow \mathrm{q})$ | premise |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 2 | $\mathrm{p} \wedge \mathrm{r}$ | assumption | $\mathrm{r} \rightarrow \mathrm{q}$ assumption <br> r ^e 2 <br> q $\rightarrow \mathrm{e} 4,3$ |  |
| 3 | $\mathrm{p} \rightarrow \mathrm{q}$ | assumption |  |  |
| 4 | p | $\wedge$ e 2 |  |  |
| 5 | q | $\rightarrow \mathrm{e} 4,3$ |  |  |
| 6 | q | ve 1, 3-5 |  |  |
| 7 | $(\mathrm{p} \wedge \mathrm{r}) \rightarrow \mathrm{q}$ | $\rightarrow \mathrm{i} 2,6$ |  |  |

d) $\neg p,(p \vee q) \vdash q$.

| 1 | $\begin{aligned} & \neg \mathrm{p} \\ & \mathrm{p} \vee \mathrm{q} \end{aligned}$ | premise premise |  |
| :---: | :---: | :---: | :---: |
| 3 | p | assumption | q assumption |
| 4 | $\perp$ | ᄀe 1,3 |  |
| 5 | q | Le 4 |  |
| 6 | q | ve 2,3-5,3 |  |

3. [1 point] Use mathematical induction to prove that $\sum_{i=1}^{n} \frac{1}{i(i+1)}=\frac{n}{n+1}$ for all $\mathrm{n} \geq 1$.

Proof:
Let $n=1$. Then the left hand side is $\frac{1}{1(1+1)}=\frac{1}{2}$ which is clearly equal to the right hand. Thus the statement we need to prove holds for $n=1$.

Assume now the statement holds for $n=k$; that is, $\sum_{i=1}^{k} \frac{1}{i(i+1)}=\frac{k}{k+1}$, and let us consider the case when $n=k+1$ :

$$
\begin{array}{ll}
\sum_{i=1}^{k+1} \frac{1}{i(i+1)}=\sum_{i=1}^{k} \frac{1}{i(i+1)}+\frac{1}{(k+1)(k+2)} & \text { splitting the sum in two parts } \\
=\frac{k}{k+1}+\frac{1}{(k+1)(k+2)} & \text { here we use the induction hypothesis! } \\
=\frac{k(k+2+1}{(k+1)(k+2)} & \text { algebraic calculation } \\
=\frac{(k+1)^{2}}{(k+1)(k+2)} & \text { algebraic calculation } \\
=\frac{k+1}{(k+2)} & \text { algebraic calculation }
\end{array}
$$

4. [2 points] Compute the conjunctive normal form of the following formulas and check which formulas are valid. Explain your answer.
a) $(p \wedge \neg q) \vee(p \wedge q)$.

$$
\begin{array}{ll}
\text { We have }(p \wedge \neg q) \vee(p \wedge q) \equiv(p \vee(p \wedge q)) \wedge(\neg q \vee(p \wedge q)) & \text { (distributive laws) } \\
\equiv(p \vee p) \wedge(p \vee q) \wedge(\neg q \vee p) \wedge(\neg q \vee q) & \text { (distributive laws) }
\end{array}
$$

Since the first three conjuncts are not valid, the entire formula is not valid.
b) $\neg(p \wedge \neg q) \wedge(q \vee \neg p)$.

We have $\neg(\mathrm{p} \wedge \neg \mathrm{q}) \wedge(\mathrm{q} \vee \neg \mathrm{p}) \equiv(\neg \mathrm{p} \vee \neg \neg \mathrm{q}) \wedge(\mathrm{q} \vee \neg \mathrm{p}) \quad($ De Morgan's laws)

$$
\equiv(\neg p \vee q) \wedge(q \vee \neg p) \quad \text { (double negation) }
$$

Since the first conjunct is not valid, the entire formula is not valid.
c) $((\mathrm{p} \rightarrow \mathrm{q}) \vee \mathrm{p}) \wedge(\mathrm{p} \vee \neg(\mathrm{r} \wedge \neg \mathrm{r} \wedge \mathrm{q}))$.

We have $((p \rightarrow q) \vee p) \wedge(p \vee \neg(r \wedge \neg r \wedge q)) \equiv((\neg p \vee q) \vee p) \wedge(p \vee \neg(r \wedge \neg r \wedge q)) \quad$ (implication)

$$
\begin{array}{ll}
\equiv(\neg p \vee q \vee p) \wedge(p \vee(\neg r \vee \neg \neg r \vee \neg q)) & \text { (De Morgan) } \\
\equiv(\neg p \vee q \vee p) \wedge(p \vee \neg r \vee r \vee \neg q) & \text { (double negation) }
\end{array}
$$

Since the both conjuncts are valid, the entire formula is valid.
d) Construct a formula $\phi$ in conjunctive normal form from the truth table

| p | q | $\phi$ |
| :---: | :---: | :---: |
| T | T | F |
| T | F | T |
| F | T | T |
| F | F | F |

The formula $\phi$ is obtained as the conjunction of the disjunction of the opposite atoms of the line where $\phi$ is false: $(\neg p \vee \neg q) \wedge(p \vee q)$
5. [1 point] Apply the marking algorithm to check if the following Horn formulas are satisfiable:
a) $(\mathrm{T} \rightarrow \mathrm{p}) \wedge((\mathrm{p} \wedge \mathrm{q}) \rightarrow \mathrm{r}) \wedge(\mathrm{p} \rightarrow \mathrm{q}) \wedge((\mathrm{r} \wedge \mathrm{p}) \rightarrow \mathrm{q})$.

Let us mark the propositions by using subscripts indicating the marking round. We have

$$
\left(\mathrm{T}_{1} \rightarrow \mathrm{p}_{2}\right) \wedge\left(\left(\mathrm{p}_{2} \wedge \mathrm{q}_{3}\right) \rightarrow \mathrm{r}_{4}\right) \wedge\left(\mathrm{p}_{2} \rightarrow \mathrm{q}_{3}\right) \wedge\left(\left(\mathrm{r}_{4} \wedge \mathrm{p}_{2}\right) \rightarrow \mathrm{q}_{3}\right)
$$

Thus the formula is satisfiable under any valuations mapping $\mathrm{p}, \mathrm{q}$ and r to T .
b) $(\mathrm{T} \rightarrow \mathrm{p}) \wedge(\mathrm{p} \rightarrow \mathrm{q}) \wedge((\mathrm{p} \wedge \mathrm{q}) \rightarrow \mathrm{r}) \wedge(\mathrm{q} \rightarrow \perp) \wedge(\mathrm{T} \rightarrow \mathrm{r})$.

Let us mark the propositions by using subscripts indicating the marking round. We have

$$
\left(\mathrm{T}_{1} \rightarrow \mathrm{p}_{2}\right) \wedge\left(\mathrm{p}_{2} \rightarrow \mathrm{q}_{3}\right) \wedge\left(\left(\mathrm{p}_{2} \wedge \mathrm{q}\right) \rightarrow \mathrm{r}_{2}\right) \wedge\left(\mathrm{q}_{3} \rightarrow \perp_{4}\right) \wedge\left(\mathrm{T}_{1} \rightarrow \mathrm{r}_{2}\right)
$$

Thus the formula is not satisfiable.
6. [2 points] Show the validity by means of natural deduction of the following sequents:
a) $\forall \mathrm{xP}(\mathrm{x}), \neg \exists \mathrm{xQ}(\mathrm{x}) \vdash \mathrm{P}(\mathrm{a}) \vee \mathrm{Q}(\mathrm{a})$.

$$
1 \quad \forall \mathrm{xP}(\mathrm{x}) \quad \text { premise }
$$

| 2 | $\neg \exists \mathrm{xQ}(\mathrm{x})$ | premise |
| :--- | :--- | :--- |
| 3 | $\mathrm{P}(\mathrm{a})$ | $\forall \mathrm{e} 1$ |
| 4 | $\mathrm{P}(\mathrm{a}) \vee \mathrm{Q}(\mathrm{a})$ | $\vee \mathrm{i}_{\mathrm{L}} 3$ |

b) $\mathrm{P}(\mathrm{a}) \vdash \forall \mathrm{x}(\mathrm{x}=\mathrm{a} \rightarrow \mathrm{P}(\mathrm{x}))$.

| $1 \quad \mathrm{P}(\mathrm{a})$ |  | assumption |
| :---: | :---: | :---: |
| 2 | $\mathrm{x}_{0}$ |  |
| 3 | $\mathrm{x}_{0}=\mathrm{a}$ | assumption |
| 4 | $\mathrm{P}\left(\mathrm{x}_{0}\right)$ | =e 2,1 |
| 6 | $\mathrm{x}_{0}=\mathrm{a} \rightarrow \mathrm{P}\left(\mathrm{x}_{0}\right)$ | $\rightarrow \mathrm{i}$ 3-4 |
| 7 | $\forall x(x=a \rightarrow P(x))$ | $\forall$ i 2-6 |

c) $\vdash \exists x(x=a \vee \neg(x=b))$.

| 1 | $a=a$ | $=$ i |
| :--- | :--- | :--- |
| 2 | $a=a \vee \neg(a=b)$ | $\vee i 1$ |
| 3 | $\exists x(x=a \vee \neg(x=b))$ | $\exists$ i $1-2$ |

d) $\vdash \neg \exists \mathrm{x} \neg(\mathrm{x}=\mathrm{x})$.

| 1 | $\exists \mathrm{x} \neg(\mathrm{x}=\mathrm{x})$ | assumption |
| :---: | :---: | :---: |
| 2 | $\mathrm{x}_{0} \quad \neg\left(\mathrm{X}_{0}=\mathrm{x}_{0}\right)$ | assumption |
| 3 | $\mathrm{x}_{0}=\mathrm{x}_{0}$ |  |
| 4 | $\perp$ | ᄀe 2,3 |
| 5 | $\perp$ | ヨe 1,2-4 |
| 6 | $\neg \exists \mathrm{x} \neg(\mathrm{x}=\mathrm{x})$ | ᄀi 1,5 |

7. [1 point] For each of the following sequents give a model showing that it is not valid:
a) $\vdash \forall \mathrm{x} \forall \mathrm{y} \forall \mathrm{z}(\mathrm{P}(\mathrm{x}, \mathrm{y}) \rightarrow \mathrm{P}(\mathrm{y}, \mathrm{z}))$.

Take the model M with the set $\{0,1\}$ as universe, and $\mathrm{P}^{\mathrm{M}}=\{(0,1)\}$. Then for the environment assigning x to 0 , y to 1 and z to 0 we have that $\mathrm{P}(\mathrm{x}, \mathrm{y}) \rightarrow \mathrm{P}(\mathrm{y}, \mathrm{z})$ does not hold.
b) $\forall \mathrm{x}(\mathrm{P}(\mathrm{x}) \vee \mathrm{Q}(\mathrm{x})) \vdash \forall \mathrm{xP}(\mathrm{x}) \vee \forall \mathrm{xQ}(\mathrm{x})$.

Take the model $M$ with the set $\{0,1\}$ as universe, and $P^{M}=\{0\}, Q^{M}=\{1\}$. Then the right hand side clearly does not hold, while for every environment either $\mathrm{P}(\mathrm{x})$ or $\mathrm{Q}(\mathrm{x})$ holds.

The final score is given by the sum of the points obtained.
