

Fuzzy Sets and Fuzzy Logic

Crisp sets

- Collection of definite, well-definable objects (elements).

Representation of sets:

- list of all elements

$$A = \{x_1, \dots, x_n\}, x_j \in X$$

- elements with property P

$$A = \{x \mid x \text{ satisfies } P\}, x \in X$$

- Venn diagram

- characteristic function

$$f_A: X \rightarrow \{0, 1\},$$

$$f_A(x) = 1, \Leftrightarrow x \in A$$

$$f_A(x) = 0, \Leftrightarrow x \notin A$$

Real numbers larger than 3:

Crisp (traditional) logic

- Crisp sets are used to define interpretations of first order logic

If P is a unary predicate, and we have no functions, a possible interpretation is

$$A = \{0,1,2\}$$

$$P^I = \{0,2\}$$

within this interpretation, $P(0)$ and $P(2)$ are true, and $P(1)$ is false.

- Crisp logic can be “fragile”: changing the interpretation a little can change the truth value of a formula dramatically.

Fuzzy sets

- Sets with fuzzy, gradual boundaries (Zadeh 1965)
- A fuzzy set A in X is characterized by its membership function $\mu_A: X \rightarrow [0,1]$

A fuzzy set A is completely determined by the set of ordered pairs

$$A = \{(x, \mu_A(x)) \mid x \in X\}$$

X is called the *domain* or *universe of discourse*

Real numbers about 3:

Fuzzy sets on discrete universes

- Fuzzy set $C =$ "desirable city to live in"
 $X = \{SF, Boston, LA\}$ (discrete and non-ordered)
 $C = \{(SF, 0.9), (Boston, 0.8), (LA, 0.6)\}$
- Fuzzy set $A =$ "sensible number of children"
 $X = \{0, 1, 2, 3, 4, 5, 6\}$ (discrete universe)
 $A = \{(0, .1), (1, .3), (2, .7), (3, 1), (4, .6), (5, .2), (6, .1)\}$

Fuzzy sets on continuous universes

- Fuzzy set B = "about 50 years old"

X = Set of positive real numbers (continuous)

B = $\{(x, \mu_B(x)) \mid x \text{ in } X\}$

$$\mu_B(x) = \frac{1}{1 + \left(\frac{x - 50}{10}\right)^2}$$

Membership Function

formulation

Triangular MF: $trimf(x; a, b, c) = \max\left(\min\left(\frac{x-a}{b-a}, \frac{c-x}{c-b}\right), 0\right)$

Trapezoidal MF: $trapmf(x; a, b, c, d) = \max\left(\min\left(\frac{x-a}{b-a}, 1, \frac{d-x}{d-c}\right), 0\right)$

Gaussian MF: $gaussmf(x; a, b) = e^{-\frac{1}{2}\left(\frac{x-a}{b}\right)^2}$

Generalized bell MF: $gbellmf(x; a, b, c) = \frac{1}{1 + \left(\frac{x-a}{b}\right)^{2a}}$

MF formulation

(a) Triangular MF

(b) Trapezoidal MF

(c) Gaussian MF

(d) Generalized Bell MF

Fuzzy sets & fuzzy logic

- Fuzzy sets can be used to define a level of truth of facts
- Fuzzy set $C =$ "desirable city to live in"

$X = \{SF, Boston, LA\}$ (discrete and non-ordered)

$C = \{(SF, 0.9), (Boston, 0.8), (LA, 0.6)\}$

corresponds to a fuzzy interpretation in which

$C(SF)$ is true with degree 0.9

$C(Boston)$ is true with degree 0.8

$C(LA)$ is true with degree 0.6

→ membership function $\mu_C(x)$ can be seen as a (fuzzy) predicate.

Notation

Many texts (especially older ones) do not use a consistent and clear notation

X is discrete

$$A = \sum_{x_i \in X} \mu_A(x_i) / x_i$$

$$A = \sum_{x_i \in X} \mu_A(x_i) x_i$$

X is continuous

$$A = \int_X \mu_A(x) / x$$

$$A = \int_X \mu_A(x) x$$

Note that Σ and integral signs stand for the union of membership grades; “/” stands for a marker and does not imply division.

Fuzzy partition

Fuzzy partition formed by the linguistic values "young", "middle aged", and "old":

Support, core, singleton

- The *support* of a fuzzy set A in X is the crisp subset of X whose elements have non-zero membership in A : $\text{supp}(A) = \{x \in X \mid \mu_A(x) > 0\}$
- The *core* of a fuzzy set A in X is the crisp subset of X whose elements have membership 1 in A : $\text{core}(A) = \{x \in X \mid \mu_A(x) = 1\}$

Normal fuzzy sets

- The *height* of a fuzzy set A is the maximum value of $\mu_A(x)$
- A fuzzy set is called *normal* if its height is 1, otherwise it is called *sub-normal*

Set theoretic operations /Fuzzy logic connectives

(Specific case)

- Subset:

$$A \subseteq B \Leftrightarrow \mu_A \leq \mu_B$$

- Complement:

$$\bar{A} = X - A \Leftrightarrow \mu_{\bar{A}}(x) = 1 - \mu_A(x)$$

- Union:

$$C = A \cup B \Leftrightarrow \mu_c(x) = \max(\mu_A(x), \mu_B(x)) = \mu_A(x) \vee \mu_B(x)$$

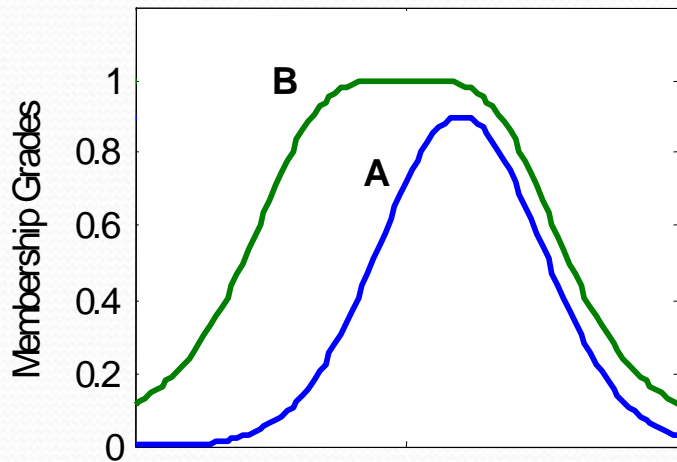

- Intersection:

$$C = A \cap B \Leftrightarrow \mu_c(x) = \min(\mu_A(x), \mu_B(x)) = \mu_A(x) \wedge \mu_B(x)$$

Set theoretic operations

$$A \subseteq B \Leftrightarrow \mu_A(x) \leq \mu_B(x)$$

A Is Contained in B

(a) Fuzzy Sets A and B

(b) Fuzzy Set "not A"

(c) Fuzzy Set "A OR B"

(d) Fuzzy Set "A AND B"

Combinations with negation

Generalized negation

- General requirements:
 - Boundary: $N(0)=1$ and $N(1) = 0$
 - Monotonicity: $N(a) > N(b)$ if $a < b$
 - Involution: $N(N(a)) = a$
- Two types of fuzzy complements:
 - Sugeno's complement:

$$N_s(a) = \frac{1-a}{1+sa}$$

- Yager's complement:

$$N_w(a) = (1-a^w)^{1/w}$$

Sugeno's and Yager's complements

Sugeno's complement:

$$N_s(a) = \frac{1-a}{1+sa}$$

Yager's complement:

$$N_w(a) = (1-a^w)^{1/w}$$

(a) Sugeno's Complements

(b) Yager's Complements

Generalized intersection (Triangular/T-norm, logical and)

- Basic requirements:
 - Boundary: $T(0, a) = T(a, 0) = 0$, $T(a, 1) = T(1, a) = a$
 - Monotonicity: $T(a, b) \leq T(c, d)$ if $a \leq c$ and $b \leq d$
 - Commutativity: $T(a, b) = T(b, a)$
 - Associativity: $T(a, T(b, c)) = T(T(a, b), c)$

Generalized intersection (Triangular/T-norm)

- Examples:

- Minimum: $T(a, b) = \min(a, b)$

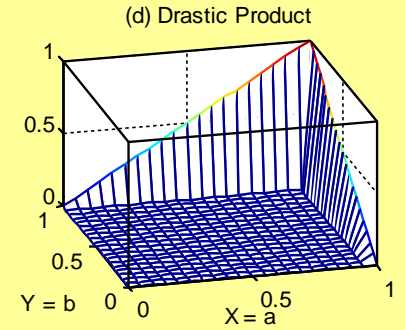

- Algebraic product: $T(a, b) = a \cdot b$

- Bounded product: $T(a, b) = \max(0, (a + b - 1))$

- Drastic product:
$$T(a, b) = \begin{cases} a & \text{if } b = 1 \\ b & \text{if } a = 1 \\ 0 & \text{otherwise} \end{cases}$$

T-norm operator

$$\text{Minimum: } T_m(a, b) \geq \text{Algebraic product: } T_a(a, b) \geq \text{Bounded product: } T_b(a, b) \geq \text{Drastic product: } T_d(a, b)$$

Generalized union (t-conorm)

- Basic requirements:

- Boundary: $S(1, a) = 1, S(a, 0) = S(0, a) = a$
- Monotonicity: $S(a, b) < S(c, d)$ if $a < c$ and $b < d$
- Commutativity: $S(a, b) = S(b, a)$
- Associativity: $S(a, S(b, c)) = S(S(a, b), c)$

- Examples:

- Maximum: $S(a, b) = \max(a, b)$
- Algebraic sum: $S(a, b) = a + b - a \cdot b$
- Bounded sum: $S(a, b) = \min(1, (a + b))$
- Drastic sum

T-conorm operator

$$\text{Maximum: } S_m(a, b) \leq \text{Algebraic sum: } S_a(a, b) \leq \text{Bounded sum: } S_b(a, b) \leq \text{Drastic sum: } S_d(a, b)$$

(a) Max

(b) Algebraic Sum

(c) Bounded Sum

(d) Drastic Sum

Generalized De Morgan's Law

- T-norms and T-conorms are duals which support the generalization of DeMorgan's law:
 - $T(a, b) = N(S(N(a), N(b)))$
 - $S(a, b) = N(T(N(a), N(b)))$
