## Digital Systems and Information <br> Part II

## Overview

- Arithmetic Operations
- General Remarks
- Unsigned and Signed Binary Operations
- Number representation using Decimal Codes
- BCD code and Seven-Segment Code
- Text representation
- Alphanumeric Codes - ASCII and Unicode
- Sound and Speech representation
- Can we talk digitally?
- Image and Video representation
- Can we see digitally?

## Arithmetic Operations

- Arithmetic operations with numbers in base $r$ follow the same rules as for decimal numbers
- Examples: addition, subtraction, and multiplication in base-2

| Carries: 111 | Borrows: | 11 | Multiplicand: Multiplier: | $\begin{array}{r} 1010 \\ \times \quad 101 \end{array}$ |
| :---: | :---: | :---: | :---: | :---: |
| Augend: 10110 | Minuend: | $00110 \sim 11101$ |  | 1010 |
| Addend: ${ }^{+} 01110$ | Subtrahend: | $11101 \times 00110$ |  | 0000 |
| Sum: 100100 | Difference: | -10111 |  | 1010 |

- In Digital Computers arithmetic operations are done with the binary number system (base-2) - Binary Arithmetic
- Binary subtraction is done by binary addition! Why?
- It is much more simple to do it that way
- Simple building block, called adder, can be implemented
- One Adder block can be used for both binary addition and subtraction

## Unsigned Binary Subtraction

- Binary subtraction done by 2's complement addition
- Assume two $\mathbf{n}$-bit unsigned numbers $\mathbf{M}$ and $\mathbf{N}, \mathbf{M}-\mathbf{N}$ can be done as follows:
- Take the 2 's complement of $\mathbf{N}$ and add it to $\mathbf{M}==>\mathbf{M}+\left(2^{n}-\mathbf{N}\right)$
- The sum is $M+\left(2^{n}-N\right)=M-N+2^{n}$
- If $M \geq N$, the sum produces an end carry, $2^{n}$. We can discard it, leaving the correct result $\mathrm{M}-\mathrm{N}$.
- If $\mathrm{M}<\mathrm{N}$, the sum does not produces an end carry because it is equal to $2^{n}-(N-M)$, which is the 2 's complement of $N-M$. To obtain the correct result take the $2^{\prime}$ 's complement of the sum, i.e., $2^{n}-\left(2^{n}-(N-M)\right)=(N-M)$ and place a minus sign in front.
- Examples:

| 5 | 0101 (5) |
| :---: | :---: |
| ${ }^{-15}{ }^{+} 0001$ (2's compl. of 15) |  |
| $\overline{-10} \bigcirc \overline{0110}$ (the sum) |  |
|  | $\downarrow$ correction is needed |
|  | -1010 ("-" 2's |

- What about binary subtraction by 1 's complement addition?
- I leave this for you as a home work (see the course web page) !!!

## Signed Binary Addition

- Assume two $\mathbf{n}$-bit signed numbers $\mathbf{M}$ and $\mathbf{N}$ in signed-2's complement format
- $\mathbf{M}+\mathbf{N}$ is done as follows:
- Add $\mathbf{M}$ and $\mathbf{N}$ including their sign bits
- A carry out of the sign bit position is discarded
- Obtained sum is always correct!
- the sum is in signed-2's complement format
- Examples:

| (-9) | $1 \mid 0111$ | (-9) | 1\|0111 | (+9) | 0\|1001 | (+9) | 0\|1001 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| + + + 5 ) | $\underline{0 \mid 0101}$ | $+(-5)$ | 1\|1011 | $+(+5)$ | $0 \backslash 0101$ | + + - 5 ) | 1\|1011 |
| (-4) | 1\|1100 | (-14) | $\overline{11 \mid 0010}$ | (+14) | 0\|1110 | (+4) | 10\|0100 |

## Signed Binary Subtraction

- Assume two $\mathbf{n}$-bit signed numbers $\mathbf{M}$ and $\mathbf{N}$ in signed-2's complement format
- $\mathbf{M}-\mathbf{N}$ is done by addition as follows:
- Take the 2's complement of $\mathbf{N}$ (including the sign bit) and add it to $\mathbf{M}$ (including the sign bit)
- A carry out of the sign bit position is discarded
- Obtained result is always correct!
- the result is in signed-2's complement format
- Examples:

$$
\left[\begin{array}{cc}
(-9) & 1 \mid 0111 \\
-\frac{(-5)}{(-4)} & \\
1 \mid 1011
\end{array}{ }^{+} \begin{array}{c}
1 \mid 0111 \\
\frac{0 \mid 0101}{1 / 1100}
\end{array}\right.
$$

$$
\begin{aligned}
& \underset{(-14)}{-(-9)} \begin{array}{l}
1 \mid 0111 \\
-(+5) \\
0 \mid 0101
\end{array}{ }^{(1| | 0010} \\
& \rightarrow \text { discard }
\end{aligned}
$$

## Binary Floating-point Operations

- Assume two binary floating-point numbers $\mathrm{F} 1=\mathrm{M} 1 \times 2^{\mathrm{E} 1}$ and $\mathrm{F} 2=\mathrm{M} 2 \times 2^{\mathrm{E} 2}$
- Multiplication: $\mathrm{F}=\mathrm{F} 1 \times \mathrm{F} 2=\mathrm{M} \times 2^{\mathrm{E}}$ ( how to find M and E )
- $\mathrm{F}=\mathrm{F} 1 \times \mathrm{F} 2=\left(\mathrm{M} 1 \times 2^{\mathrm{E} 1}\right) \times\left(\mathrm{M} 2 \times 2^{\mathrm{E} 2}\right)=(\mathrm{M} 1 \times \mathrm{M} 2) \times 2^{(\mathrm{E} 1+\mathrm{E} 2)}$
- Division: $F=F 1 / F 2=M \times 2^{E}$ (how to find $M$ and $E$ )
- $\mathrm{F}=\mathrm{F} 1 / \mathrm{F} 2=\left(\mathrm{M} 1 \times 2^{\mathrm{E} 1}\right) /\left(\mathrm{M} 2 \times 2^{\mathrm{E} 2}\right)=(\mathrm{M} 1 / \mathrm{M} 2) \times 2^{(\mathrm{E} 1-\mathrm{E} 2)}$
- Addition: $\mathrm{F}=\mathrm{F} 1+\mathrm{F} 2=\mathrm{M} \times 2^{\mathrm{E}}$ ( how to find M and E )
- If $\mathrm{E} 1 \geq \mathrm{E} 2$ then $\mathrm{F}=\mathrm{F} 1+\mathrm{F} 2=\left(\mathrm{M} 1 \times 2^{\mathrm{E} 1}\right)+\left(\mathrm{M} 2 \times 2^{\mathrm{E} 2}\right)=$ $=\mathrm{M} 1 \times 2^{\mathrm{E} 1}+\left(\mathrm{M} 2 \times 2^{(\mathrm{E} 2-\mathrm{E} 1)}\right) \times 2^{\mathrm{E} 1}=\left(\mathrm{M} 1+\left(\mathrm{M} 2 \times 2^{-(\mathrm{E} 1-\mathrm{E} 2)}\right)\right) \times 2^{\mathrm{E} 1}$
- Subtraction: $F=F 1-F 2=M \times 2^{E}$ ( how to find $M$ and $E$ )
- If $\mathrm{E} 1 \geq \mathrm{E} 2$ then $\mathrm{F}=\mathrm{F} 1-\mathrm{F} 2=\left(\mathrm{M} 1 \times 2^{\mathrm{E} 1}\right)-\left(\mathrm{M} 2 \times 2^{\mathrm{E} 2}\right)=$ $=\mathrm{M} 1 \times 2^{\mathrm{E} 1}-\left(\mathrm{M} 2 \times 2^{(\mathrm{E} 2-\mathrm{E} 1)}\right) \times 2^{\mathrm{E} 1}=\left(\mathrm{M} 1-\left(\mathrm{M} 2 \times 2^{-(\mathrm{E} 1-\mathrm{E} 2)}\right)\right) \times 2^{\mathrm{E} 1}$
- After each operation, M has to be normalized (if necessary) by shifting it to the left and decrementing E until a nonzero bit appears in the first position.
- Example:
$-\frac{5.00}{\frac{2.75}{2.25}} \stackrel{\begin{array}{l}(+0.101000)_{2} \times 2^{(0111)_{2}} \\ (+0.101100)_{2} \times 2^{(010)_{2}}\end{array}}{\longrightarrow} \xrightarrow{-\begin{array}{l}(+0.101000)_{2} \times 2^{(011)_{2}} \\ (+0.010110)_{2} \times 2^{(0111) 2}\end{array}} \begin{gathered}\text { normalized result } \\ (+0.0010)_{2} \times 2^{(011)_{2}}\end{gathered}{ }^{(+0.100100)_{2} \times 2^{(010)_{2}}}$
Fall $2023 \quad$ Fundamentals of Digital Systems Design by Todor Stefanov, Leiden University

## Number Representation using Decimal Codes

- The binary number system is used in digital computers
- BUT people are accustomed to the decimal system
- We can resolve this difference by
- converting decimal numbers to binary
- performing all arithmetic calculations in binary
- converting the binary result back to decimal
- You already know how to do this!
- Digital computers can do this as well, BUT:
- We have to store the decimal numbers in the computer in a way that they can be converted to binary
- Since the computer can accept only 1's and 0's, we must represent the decimal digits by a code that contains 1 's and 0 's

## Binary Coded Decimals (BCD)

- BCD code is the most commonly used code
- Each decimal digit is coded by a 4-bit string called BCD digit
- A decimal number is converted to a BCD number by replacing each decimal digit with the corresponding BCD digit code
- Example:

$$
(369)_{10}=\left(\frac{0011}{3} \frac{0110}{6} \frac{1001}{9}\right)_{B C D}=(101110001)_{2}
$$

- A BCD number needs more bits than its equivalent binary value!
- However, the advantages of using BCD are:
- BCD numbers are decimal numbers even though they are represented 1 s and 0 s
- Computer input/output data are handled by people who use the decimal system
- Computers can store decimal numbers using BCD, convert the BCD numbers to binary, perform binary operations, and convert the result back to BCD

| Decimal Digit | BCD Digit |
| :---: | :---: |
| 0 | 0000 |
| 1 | 0001 |
| 2 | 0010 |
| 3 | 0011 |
| 4 | 0100 |
| 5 | 0101 |
| 6 | 0110 |
| 7 | 0111 |
| 8 | 1000 |
| 9 | 1001 |

[^0]
## Binary Coded Decimals (BCD)

- Converting a BCD number to a binary number

$$
\begin{aligned}
(25)_{10} & =(00100101)_{\mathrm{BCD}}=(0010)_{2} \times 10^{1}+(0101)_{2} \times 10^{0}= \\
& =(0010)_{2} \times(1010)_{2}+(0101)_{2} \times(0001)_{2}= \\
& =(10100)+(0101)=(11001)_{2}
\end{aligned}
$$

- Converting a binary number to a BCD number Convert the number $(11001)_{2}$ by dividing it to $(1010)_{2}=(10)_{10}$
$(11001)_{2} /(1010)_{2}=(0010)_{2}$ and Remainder $=(0101)_{2} \uparrow$ Least significant BCD digit $(0010)_{2} /(1010)_{2}=(0000)_{2}$ and Remainder $=(0010)_{2}$ Most significant BCD digit

$$
(11001)_{2}=(00100101)_{\mathrm{BCD}}=(25)_{10}
$$

- BCD Arithmetic
- Digital computers can perform arithmetic operations directly with decimal numbers stored in BCD code
- How is this done? (study the text book or go to internet for information)

## Other Useful Decimal Codes: Excess-3 Code

- Given a decimal digit $n$, its corresponding excess-3 codeword is $(n+3)_{2}$
- Example:

$$
\begin{aligned}
& \mathrm{n}=5 \rightarrow \mathrm{n}+3=8 \rightarrow 1000_{\text {excess-3 }} \\
& \mathrm{n}=0 \rightarrow \mathrm{n}+3=3 \rightarrow 0011_{\text {excess }}
\end{aligned}
$$

- Decimal number in Excess-3 code.
- Example:
$(158)_{10}=\left(\frac{0100}{1+3} \frac{1000}{5+3} \frac{1011}{8+3}\right)_{\text {excess-3 }}=(10011110)_{2}$

| Decimal <br> Digit | Excess-3 <br> Digit |
| :---: | :---: |
| 0 | 0011 |
| 1 | 0100 |
| 2 | 0101 |
| 3 | 0110 |
| 4 | 0111 |
| 5 | 1000 |
| 6 | 1001 |
| 7 | 1010 |
| 8 | 1011 |
| 9 | 1100 |

- Useful in some cases for digital arithmetic, e.g., decimal subtraction.

## Another Useful Decimal Code: Seven-Segment Code

- Used to display numbers on seven-segment displays
- Seven-segment display:
- 7 LEDs (light emitting diodes), each one controlled by an input
- 1 means "on", 0 means "off"
- Display digit " 3 "?
- Set a, b, c, d, g to 1
- Set e, f to 0

| Decimal Digit | 7-Segment Code |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{a}$ | $\mathbf{b}$ | $\mathbf{c}$ | $\mathbf{d}$ | $\mathbf{e}$ | $\mathbf{f}$ | $\mathbf{g}$ |
| 0 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 |
| 2 | 1 | 1 | 0 | 1 | 1 | 0 | 1 |
| 3 | 1 | 1 | 1 | 1 | 0 | 0 | 1 |
| 4 | 0 | 1 | 1 | 0 | 0 | 1 | 1 |
| 5 | 1 | 0 | 1 | 1 | 0 | 1 | 1 |
| 6 | 1 | 0 | 1 | 1 | 1 | 1 | 1 |
| 7 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| 8 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 9 | 1 | 1 | 1 | 1 | 0 | 1 | 1 |

## Text Representation using Alphanumeric Codes

- Digital computers need to handle data consisting not only of numbers, but also of letters
- Alphanumeric character set of English includes:
- The 10 decimal digits
- The 26 letters of the alphabet (uppercase and lowercase letters)
- Several special characters (more than three)
- We need to code these symbols
- The code must be binary - computers can handle only 0's and 1's
- We need binary code of at least seven bits ( $2^{7}=128$ symbols)
- American Standard Code for Information Interchange (ASCII)
- 7-bit standard code for representing symbols of the English language
- Unicode
- 16-bit standard code for representing the symbols of other languages

## ASCII Code Table

American Stamdard Code for Information Imterchange (ASCII)

| $\mathbf{B}_{4} \mathbf{B}_{3} \mathbf{B}_{2} \mathbf{B}_{1}$ | $\mathrm{B}_{7} \mathrm{~B}_{6} \mathrm{~B}_{5}$ |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| CR | Carriage return | GS | Group separator |
| SO | Shift out | RS | Record separator |
| SI | Shift in | US | Unit separator |
| SP | Space | DEL | Delete |

Fall $2023 \quad$ Fundamentals of Digital Systems Design by Todor Stefanov, Leiden University

## How can we talk digitally?

- Digital Systems manipulate discrete quantities of information
- Speech and music are continuous (non-discrete) quantities of information
- How a Digital System can handle this continuous information?

1) Signal is sampled in time at 8000 samples per second
2) Each sample is quantized and coded by a single byte
3) After (1) and (2) we get discrete quantity of information:

- The cost is $64 \mathrm{Kbit} / \mathrm{sec}$ which is way too much!
- Digital Signal Processing techniques allow us to bring this amount down to as low as 2.4 Kbit/s.

## How can we see digitally?

- Image and video are continuous (non-discrete) quantities of information. How a Digital System handles it?

## What happens in here?

1) Video Signal is sampled in time at 24 images (frames) per second
2) Each image is sampled in space at 3.2 mega pixels per image
3) Each pixel is quantized and coded by 3 bytes (Red, Green, Blue)
4) After (1), (2), and (3) we get discrete quantity of information:

- The cost is $1.8432 \mathrm{Gbit} / \mathrm{sec}$ which is huge!!!
- Image Compression techniques (JPEG, MPEG-4, H.264) allow us to bring this amount down to several Mbit/s

## Combinational Logic Circuits Part I -Theoretical Foundations

## Overview

- What is a combinational logic circuit?
- Boolean Algebra
- Basic Logic Operations
- Basic Identities
- Basic Principles, Properties, and Theorems
- Boolean Function and Representations
- Truth Table
- Canonical and Standard Forms
- Karnaugh Maps (K-Maps)

## Combinational Logic Circuits

- Digital Systems are made out of digital circuits
- Digital circuits are hardware components that manipulate binary information
- Certain well defined basic (small) digital circuits are called Logic Gates
- Gates have inputs and outputs and perform specific mathematical logic operations
- Outputs of gates are connected to inputs of other gates to form a digital combinational logic circuit.

## Boolean Algebra

- To analyze and design digital combinational logic circuits we need a mathematical system
- A system called Boolean Algebra is used
- George Boole (1815-1864): "An investigation of the laws of thought" - a book published in 1854 introducing the mathematical theory of logic
- Boolean Algebra deals with binary variables that take 2 discrete values (0 and 1), and with logic operations
- Binary/logic variables are typically represented as letters: $A, B, C, \ldots, X, Y, Z$ or $a, b, c, \ldots, x, y, z$
- Three basic logic operations:
- AND, OR, NOT (complementation)

## Basic Logic Operations

- AND operation is represented by operators "•" or " $\wedge$ " or by the absence of an operator.
- $Z=X \cdot Y$ or $Z=X \wedge Y$, or $Z=X Y$ is read " $Z$ is equal to $X$ AND $Y$ " meaning that:
- $Z=1$ if and only if $X=1$ and $Y=1$; otherwise $Z=0$.
- AND resembles binary multiplication:

$$
\begin{array}{ll}
0 \cdot 0=0, & 0 \cdot 1=0, \\
1 \cdot 0=0, & 1 \cdot 1=1
\end{array}
$$

- OR operation is represented by operators "+" or " $\vee$ ".
- $Z=X+Y$ or $Z=X V Y$ is read " $Z$ is equal to $X O R Y$ " meaning that:
- $Z=1$ if $X=1$ or $Y=1$, or if both $X=1$ and $Y=1$, i.e., $Z=0$ if and only if $X=0$ and $\mathrm{Y}=0$.
- OR resembles binary addition, except in one case:

$$
\begin{array}{ll}
0+0=0, & 0+1=1, \\
1+0=1, & 1+1=1\left(\neq 10_{2}\right)
\end{array}
$$

- NOT operation is represented by operator " " " or by a bar over a variable.
- $Z=X$ ' or $Z=\bar{X}$ is read " $Z$ is equal to NOT $X$ " meaning that:
- $Z=1$ if $X=0$; but $Z=0$ if $X=1$
- NOT operation is also referred to as complement operation.

Fall 2023

## Basic Identities of Boolean Algebra

Let $X$ be a boolean variable and 0,1 constants

1. $X+0=X \quad-$ Zero Axiom
2. $X \cdot 1=X$-- Unit Axiom
3. $X+1=1$-- Unit Property
4. $X \cdot 0=0 \quad-$ Zero Property
5. $X+X=X \quad$-- Idempotence
6. $X \cdot X=X \quad$-- Idempotence
7. $X+X^{\prime}=1$-- Complement
8. $X \cdot X^{\prime}=0 \quad$-- Complement
9. $\left(X^{\prime}\right)^{\prime}=X \quad--$ Involution

## Boolean Algebra Properties

Let $X, Y$, and $Z$ be boolean variables
Commutative

$$
\text { 10. } X+Y=Y+X \quad \text { 11. } X \cdot Y=Y \cdot X
$$

- Associative

12. $\mathrm{X}+(\mathrm{Y}+\mathrm{Z})=(\mathrm{X}+\mathrm{Y})+\mathrm{Z} \quad$ 13. $\mathrm{X} \cdot(\mathrm{Y} \cdot \mathrm{Z})=(\mathrm{X} \cdot \mathrm{Y}) \cdot \mathrm{Z}$

- Distributive

14. $X \cdot(Y+Z)=X \cdot Y+X \cdot Z \quad$ 15. $X+(Y \cdot Z)=(X+Y) \cdot(X+Z)$

DeMorgan's Theorem
16. $(X+Y)^{\prime}=X^{\prime} \cdot Y^{\prime} \quad$ 17. $(X \cdot Y)^{\prime}=X^{\prime}+Y^{\prime}$

In general for DeMorgan,

- ( $\mathrm{X} 1+\mathrm{X} 2+\ldots+\mathrm{Xn})^{\prime}=\mathrm{X} 1^{\prime} \cdot \mathrm{X} 2^{\prime} \cdot \ldots \cdot \mathrm{Xn}{ }^{\prime}$,
- ( $\mathrm{X} 1 \cdot \mathrm{X} 2 \cdot \ldots \cdot \mathrm{Xn})^{\prime}=\mathrm{X} 1^{\prime}+\mathrm{X} 2^{\prime}+\ldots+\mathrm{Xn}{ }^{\prime}$

## The Duality Principle

- The dual of an expression is obtained by exchanging ( $\cdot$ and + ), and ( 1 and 0 ) in it, provided that the precedence of operations is not changed
- Cannot exchange x with x
- Example:
- Find the dual of expression: $x^{\prime} y z^{\prime}+x^{\prime} y^{\prime} z$
- Answer: ( $x^{\prime}+y+z$ ') $\left(x^{\prime}+y^{\prime}+z\right)$
- The dual expression does not always equal the original expression
- If a Boolean equation/equality is valid, its dual is also valid

## The Duality Principle (cont.)

With respect to duality, Identities $1-8$ and Properties $10-17$ have the following relationship:

$$
\begin{array}{lcc}
\text { 1. } X+0=X & \text { 2. } X \cdot 1=X & \text { (dual of 1) } \\
\text { 3. } X+1=1 & \text { 4. } X \cdot 0=0 & \text { (dual of 3) } \\
\text { 5. } X+X=X & \text { 6. } X \cdot X=X & \text { (dual of 5) } \\
\text { 7. } X+X^{\prime}=1 & \text { 8. } X \cdot X^{\prime}=0 & \text { (dual of 7) } \\
& & \\
\text { 10. } X+Y=Y+X & \text { 11. } X \cdot Y=Y \cdot X & \text { (dual of 10) } \\
\text { 12. } X+(Y+Z)=(X+Y)+Z & \text { 13. } X \cdot(Y \cdot Z)=(X \cdot Y) \cdot Z & \text { (dual of 12) } \\
\text { 14. } X \cdot(Y+Z)=X \cdot Y+X \cdot Z & \text { 15. } X+(Y \cdot Z)=(X+Y) \cdot(X+Z) & \text { (dual of14) } \\
\text { 16. }(X+Y)^{\prime}=X^{\prime} \cdot Y^{\prime} & \text { 17. }(X \cdot Y)^{\prime}=X^{\prime}+Y^{\prime} & \text { (dual of16) }
\end{array}
$$

## Absorption Property (Covering)

- $X+X \cdot Y=X$-- (absorption property)
- $\quad X \cdot(X+Y)=X \quad$-- (dual absorption property)
- Proof:

$$
\begin{aligned}
X+X \cdot Y & =X \cdot 1+X \cdot Y \\
& =X \cdot(1+Y) \\
& =X \cdot 1 \\
& =X
\end{aligned}
$$

Can you prove the dual absorption property?

## Consensus Theorem

- $\quad X Y+X^{\prime} Z+Y Z=X Y+X^{\prime} Z$
-- (theorem)
- $\quad(X+Y) \cdot\left(X^{\prime}+Z\right) \cdot(Y+Z)=(X+Y) \cdot\left(X^{\prime}+Z\right) \quad$-- (dual theorem)
- Proof:

$$
\begin{aligned}
X Y+X^{\prime} Z+Y Z & =X Y+X^{\prime} Z+\left(X+X^{\prime}\right) Y Z \\
& =X Y+X^{\prime} Z+X Y Z+X^{\prime} Y Z \\
& =(X Y+X Y Z)+\left(X^{\prime} Z+X^{\prime} Z Y\right) \\
& =X Y+X^{\prime} Z
\end{aligned}
$$

- Can you prove the dual consensus theorem?

## Boolean Function

- F (vars) $=$ Boolean expression

set of binary
variables
- Operators ( +, •, ')
- Variables
- Constants ( 0,1 )
- Groupings (parenthesis)
- Example: $F(a, b)=a^{\prime} \cdot b+b^{\prime}$

$$
G(x, y, z)=x \cdot\left(y+z^{\prime}\right)
$$

- Terminology:
- Literal: A variable or its complement (Example: x or b' ).
- Product term: literals connected by "•" (Example: a'• b ).
- Sum term: literals connected by " + " (Example $y+z$ ').

## Boolean Function Representations

- Truth Table (unique representation)
- Boolean Equation
- Canonical Sum-Of-Products (CSOP) form (unique)
- Canonical Product-Of-Sums (CPOS) form (unique)
- Standard Forms (NOT unique representations)
- Map (unique representation)
- We can convert one representation of a Boolean function into another in a systematic way
- Why do we need all these representations?

## Truth Table

- Tabular form that uniquely represents the relationship between the input
$F(x, y, z)$ variables of a Boolean function and its output
- Enumerates all possible combinations of 1's and 0's that can be assigned to binary variables
- Shows binary value of the function for each possible binary combination
- Example:

| $x$ | $y$ | $z$ | $F$ |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 |
| 0 | 0 | 1 | 0 |
| 0 | 1 | 0 | 0 |
| 0 | 1 | 1 | 1 |
| 1 | 0 | 0 | 1 |
| 1 | 0 | 1 | 1 |
| 1 | 1 | 0 | 0 |
| 1 | 1 | 1 | 0 |

## Truth Table (cont.)

- Assume a Boolean function $\mathrm{F}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{N}-1}, \mathrm{x}_{\mathrm{N}}\right)$ that depends on $N$ variables
- Question1: How many columns are there in the truth table of $\mathrm{F}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{N}-1}, \mathrm{x}_{N}\right)$ ?
- Question2: How many rows are there in the truth table of $\mathrm{F}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \ldots, \mathrm{x}_{\mathrm{N}-1}, \mathrm{x}_{\mathrm{N}}\right)$ ?
- Answer Q1: columns = N + 1
- a column is needed for each variable and 1 column is needed for the values of the function
- Answer Q2: rows $=2^{\mathrm{N}}$
- there are $2^{\mathrm{N}}$ possible binary combinations for $N$ variables

## Truth Table (cont.)

- Truth table: a unique representation of a Boolean function
- If two functions have identical truth tables, the functions are equivalent (and vice-versa)
- Truth tables can be used to prove equality theorems
- Proof of the DeMorgan's Theorem: $(\mathbf{X}+\mathrm{Y})^{\prime}=\mathrm{X}^{\prime} \cdot \mathrm{Y}^{\prime}$

| $X$ | $Y$ | $X+Y$ | $F 1=(X+Y)^{\prime}$ |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 1 |
| 0 | 1 | 1 | 0 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 1 | 0 |

| $X$ | $Y$ | $X^{\prime}$ | $Y^{\prime}$ | $F 2=X^{\prime} \cdot Y^{\prime}$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | 1 | 1 |
| 0 | 1 | 1 | 0 | 0 |
| 1 | 0 | 0 | 1 | 0 |
| 1 | 1 | 0 | 0 | 0 |

Observe: F1 and F2 have identical truth tables => F1 = F2, i.e., the theorem is proved

- The size of a truth table grows exponentially with the number of variables involved
- This motivates the use of other representations!

[^0]:    Note: the binary combinations 1010 through 1111 are not used and have no meaning in the BCD code
