SLR Parsing / Backpatching

FIRST

- Let α be string of grammar symbols
- $\text{FIRST}(\alpha) = \text{set of terminals/tokens which begin strings derived from } \alpha$
- If $\alpha \xrightarrow{*} \epsilon$, then $\epsilon \in \text{FIRST}(\alpha)$
- Example

$$F \rightarrow (E) \mid \mathbf{id}$$

$$\text{FIRST}(FT') = \{(, \mathbf{id}\}$$

- When nonterminal has multiple productions, e.g.,

$$A \rightarrow \alpha \mid \beta$$

and $\text{FIRST}(\alpha)$ and $\text{FIRST}(\beta)$ are disjoint,
we can choose between these A -productions by looking at
next input symbol

Computing FIRST

Compute $\text{FIRST}(X)$ for all grammar symbols X :

- If X is terminal, then $\text{FIRST}(X) = \{X\}$
- If $X \rightarrow \epsilon$ is production, then add ϵ to $\text{FIRST}(X)$
- Repeat adding symbols to $\text{FIRST}(X)$ by looking at productions

$$X \rightarrow Y_1 Y_2 \dots Y_k$$

(see book) until all FIRST sets are stable

FIRST (Example)

$$\begin{array}{l} E \rightarrow TE' \\ E' \rightarrow +TE' \mid \epsilon \\ T \rightarrow FT' \\ T' \rightarrow *FT' \mid \epsilon \\ F \rightarrow (E) \mid \mathbf{id} \end{array}$$

$$\text{FIRST}(E) = \text{FIRST}(T) = \text{FIRST}(F) = \{(, \mathbf{id}\}$$

$$\text{FIRST}(E') = \{+, \epsilon\}$$

$$\text{FIRST}(T') = \{*, \epsilon\}$$

FOLLOW

- Let A be nonterminal
- $\text{FOLLOW}(A)$ is set of terminals/tokens that can appear immediately to the right of A in sentential form:

$$\text{FOLLOW}(A) = \{a \mid S \xrightarrow{*} \alpha A a \beta\}$$

- Compute $\text{FOLLOW}(A)$ for all nonterminals A
See book

FIRST and FOLLOW (Example)

$$\begin{aligned} E &\rightarrow TE' \\ E' &\rightarrow +TE' \mid \epsilon \\ T &\rightarrow FT' \\ T' &\rightarrow *FT' \mid \epsilon \\ F &\rightarrow (E) \mid \mathbf{id} \end{aligned}$$

$$\text{FIRST}(E) = \text{FIRST}(T) = \text{FIRST}(F) = \{(, \mathbf{id}\}$$

$$\text{FIRST}(E') = \{+, \epsilon\}$$

$$\text{FIRST}(T') = \{*, \epsilon\}$$

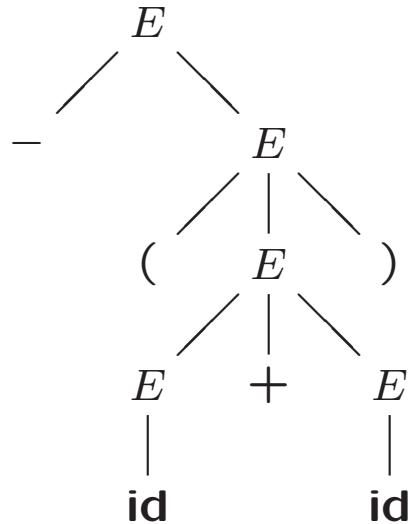

$$\text{FOLLOW}(E) = \text{FOLLOW}(E') = \{(), \$\}$$

$$\text{FOLLOW}(T) = \text{FOLLOW}(T') = \{+, (), \$\}$$

$$\text{FOLLOW}(F) = \{*, +, (), \$\}$$

Parse Trees and Derivations

$$E \xrightarrow{lm} -E \xrightarrow{lm} -(E) \xrightarrow{lm} -(E + E) \xrightarrow{lm} -(\mathbf{id} + E) \xrightarrow{lm} -(\mathbf{id} + \mathbf{id})$$

Leftmost derivation

≈ WLR construction tree

≈ top-down parsing

Rightmost derivation

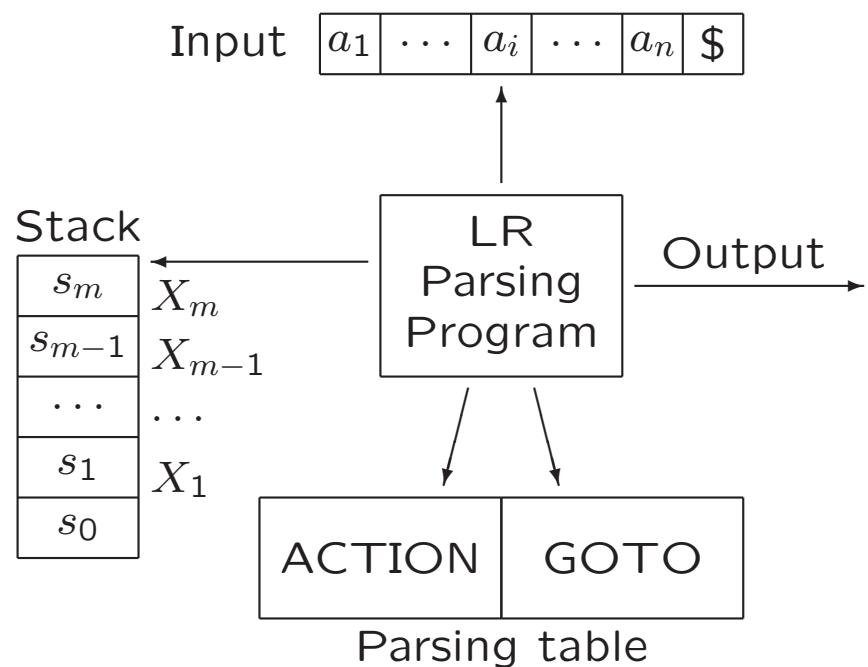

≈ WRL construction tree

Bottom-up parsing

≈ LRW construction tree

≈ rightmost derivation in reverse

LR Parsing

Simple LR Parsing

States are sets of [LR\(0\) items](#)

Production $A \rightarrow XYZ$ yields four items:

$$\begin{aligned} A &\rightarrow \cdot XYZ \\ A &\rightarrow X \cdot YZ \\ A &\rightarrow XY \cdot Z \\ A &\rightarrow XYZ \cdot \end{aligned}$$

Item indicates how much of production we have seen in input

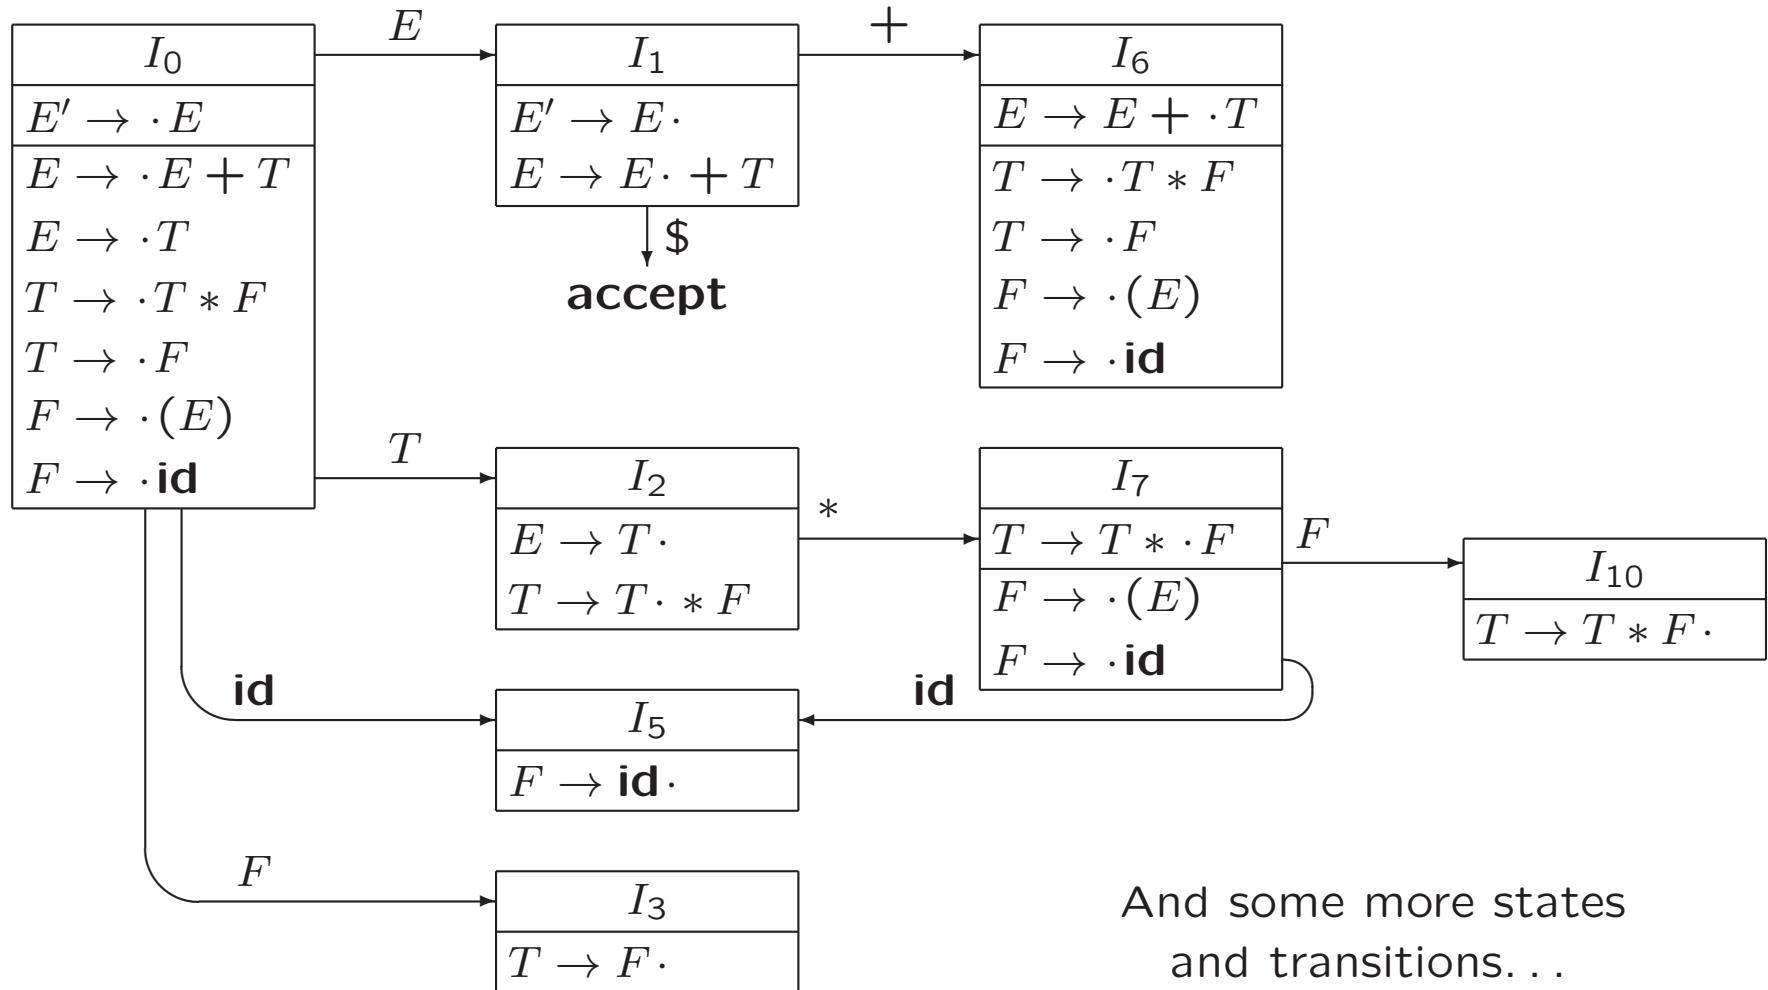

LR(0) items are combined in sets

[Canonical LR\(0\) collection](#) is specific collection of item sets
These item sets are the states in [LR\(0\) automaton](#),
a DFA that is used for making parsing decisions

Closure of Item Sets

- – Consider $A \rightarrow \alpha \cdot B\beta$
 - We expect to see substring derivable from $B\beta$, with prefix derivable from B , by applying B -production
 - Hence, add $B \rightarrow \cdot\gamma$ for all $B \rightarrow \gamma$
- Let I be item set
 1. Add every item in I to $\text{CLOSURE}(I)$
 2. Repeat
 - If $A \rightarrow \alpha \cdot B\beta$ is in $\text{CLOSURE}(I)$ and $B \rightarrow \gamma$ is production, then add $B \rightarrow \cdot\gamma$ to $\text{CLOSURE}(I)$
 - until no more new items are added

LR(0) Automaton (Example)

Possible Actions in SLR Parsing

For state i and input symbol a ,

- if $[A \rightarrow \alpha \cdot a\beta]$ is in I_i and $\text{GOTO}(I_i, a) = I_j$
then shift j is possible
(a must be terminal, not $\$$)
- if $[A \rightarrow \alpha \cdot]$ is in I_i and $a \in \text{FOLLOW}(A)$,
then reduce $A \rightarrow \alpha$ is possible (A may not be S')
- if $[S' \rightarrow S \cdot]$ is in I_i and $a = \$$, then accept is possible

If conflicting actions result from this, then grammar is not SLR(1)

Behaviour of LR Parser

LR parser configuration is pair (stack contents, remaining input):

$$(s_0 s_1 s_2 \dots s_m, a_i a_{i+1} \dots a_n \$)$$

which represents right-sentential form

$$X_1 X_2 \dots X_m a_i a_{i+1} \dots a_n$$

1. If $\text{ACTION}[s_m, a_i] = \text{shift } s$, then push s and advance input:

$$(s_0 s_1 s_2 \dots s_m s, a_{i+1} \dots a_n \$)$$

2. If $\text{ACTION}[s_m, a_i] = \text{reduce } A \rightarrow \beta$, where $|\beta| = r$, then pop r symbols. If $\text{GOTO}[s_{m-r}, A] = s$, then push s :

$$(s_0 s_1 s_2 \dots s_{m-r} s, a_i a_{i+1} \dots a_n \$)$$

3. If $\text{ACTION}[s_m, a_i] = \text{accept}$, then stop
4. If $\text{ACTION}[s_m, a_i] = \text{error}$, then call error recovery routine

SLR Parsing Table (Example)

	State	ACTION					GOTO		
		id	+	*	()	\$	<i>E</i>	<i>T</i>	<i>F</i>
(1) $E \rightarrow E + T$	0	s5			s4		1	2	3
	1		s6			acc			
	2		r2	s7		r2	r2		
	3		r4	r4		r4	r4		
	4	s5			s4		8	2	3
	5		r6	r6		r6	r6		
	6	s5			s4			9	3
	7	s5			s4				10
	8		s6			s11			
	9		r1	s7		r1	r1		
	10		r3	r3		r3	r3		
	11		r5	r5		r5	r5		

Blank means error

Line	Stack	Symbols	Input	Action
(1)	0	\$	id * id \$	shift to 5
(2)	05	\$ id	* id \$	reduce by $F \rightarrow \text{id}$
(3)	03	\$ F	* id \$...

Exercise

(Derived from problem 1b from exam, 29 January 2002)

- Determine FIRST and FOLLOW for nonterminals
- Construct LR(0) automaton
- Construct parsing table
- Parse the string $p \ q \ + \ - \ p$

6.7 Backpatching

- Code generation problem:
 - Labels (addresses) that control must go to may not be known at the time that jump statements are generated
- One solution:
 - Separate pass to bind labels to addresses
- Other solution: backpatching
 - Generate jump statements with empty target
 - Add such statements to a list
 - Fill in labels when proper label is determined

Backpatching

- **Synthesized** attributes $B.\text{truelist}$, $B.\text{falselist}$, $S.\text{nextlist}$ containing lists of jumps
- Three functions
 1. $\text{makelist}(i)$ creates new list containing index i
 2. $\text{merge}(p_1, p_2)$ concatenates lists pointed to by p_1 and p_2
 3. $\text{backpatch}(p, i)$ inserts i as target label for each instruction on list pointed to by p

Translation Scheme for Backpatching

(Boolean Expressions)

$B \rightarrow B_1 \mid\mid MB_2$	{ <i>backpatch</i> ($B_1.\text{falselist}$, $M.\text{instr}$); $B.\text{truelist} = \text{merge}(B_1.\text{truelist}, B_2.\text{truelist})$; } $B.\text{falselist} = B_2.\text{falselist}$;
$B \rightarrow B_1 \&\& MB_2$	{ <i>backpatch</i> ($B_1.\text{truelist}$, $M.\text{instr}$); $B.\text{truelist} = B_2.\text{truelist}$; $B.\text{falselist} = \text{merge}(B_1.\text{falselist}, B_2.\text{falselist})$; }
$B \rightarrow (B_1)$	{ $B.\text{truelist} = B_1.\text{truelist}$; $B.\text{falselist} = B_1.\text{falselist}$; }
$B \rightarrow E_1 \text{ rel } E_2$	{ $B.\text{truelist} = \text{makelist}(\text{nextinstr})$; $B.\text{falselist} = \text{makelist}(\text{nextinstr} + 1)$; <i>gen</i> ('if' $E_1.\text{addr}$ rel.op $E_2.\text{addr}$ 'goto _'); <i>gen</i> ('goto _'); }
$M \rightarrow \epsilon$	{ $M.\text{instr} = \text{nextinstr}$; }

Exercise

(Derived from problem 6.7.1(a) from second edition book)

- Construct the parse tree for the following boolean expression:

$a==b \&& (c==d \mid\mid e==f)$

- Using the translation scheme of Fig. 6.43, translate the above expression.

Show the true and false lists for each subexpression.

You may assume the address of the first instruction generated is 100.

The semantic actions needed from Fig. 6.43 are listed in the previous slide. They are also listed in the next slide, with a different numbering of the variables. This numbering may be more useful for the exercise.

Translation Scheme for Backpatching

(Boolean Expressions)

$B_3 \rightarrow B_4 \mid\mid M_2 B_5$	{ <i>backpatch</i> ($B_4.\text{falselist}$, $M_2.\text{instr}$); $B_3.\text{truelist} = \text{merge}(B_4.\text{truelist}, B_5.\text{truelist})$; } $B_3.\text{falselist} = B_5.\text{falselist}$;
$B \rightarrow B_1 \&\& M_1 B_2$	{ <i>backpatch</i> ($B_1.\text{truelist}$, $M_1.\text{instr}$); $B.\text{truelist} = B_2.\text{truelist}$; $B.\text{falselist} = \text{merge}(B_1.\text{falselist}, B_2.\text{falselist})$; }
$B_2 \rightarrow (B_3)$	{ $B_2.\text{truelist} = B_3.\text{truelist}$; $B_2.\text{falselist} = B_3.\text{falselist}$; }
$B \rightarrow E_1 \text{ rel } E_2$	{ $B.\text{truelist} = \text{makelist}(\text{nextinstr})$; $B.\text{falselist} = \text{makelist}(\text{nextinstr} + 1)$; $\text{gen('if' } E_1.\text{addr rel.op } E_2.\text{addr 'goto '_})$; gen('goto '_) ; }
$M \rightarrow \epsilon$	{ $M.\text{instr} = \text{nextinstr}$; }

Translation Scheme for Backpatching

(Flow-of-Control Statements)

$S \rightarrow \text{if } (B) MS_1$	{	$\text{backpatch}(B.\text{truelist}, M.\text{instr});$
		$S.\text{nextlist} = \text{merge}(B.\text{falselist}, S_1.\text{nextlist});$ }
$S \rightarrow \{L\}$	{	$S.\text{nextlist} = L.\text{nextlist};$ }
$S \rightarrow A;$	{	$S.\text{nextlist} = \text{null};$ }
$M \rightarrow \epsilon$	{	$M.\text{instr} = \text{nextinstr};$ }
$L \rightarrow L_1 MS$	{	$\text{backpatch}(L_1.\text{nextlist}, M.\text{instr});$
		$L.\text{nextlist} = S.\text{nextlist};$ }
$L \rightarrow S$	{	$L.\text{nextlist} = S.\text{nextlist};$ }

Exercise

(Extension of problem 6.7.1(a) from second edition book)

- Construct the parse tree for the following ‘program’:

```
{ if (a==b && (c==d || e==f)) x=1; y=x+1 }
```

- Using the translation scheme of Fig. 6.43 and Fig. 6.46, translate the above program.

Show the next list for each statement or statement list.

You may assume the address of the first instruction generated is 100.

The semantic actions needed from Fig. 6.46 are listed in the previous slide. They are also listed in the next slide, with a different numbering of the variables. This numbering may be more useful for the exercise.

Translation Scheme for Backpatching

(Flow-of-Control Statements)

$S_2 \rightarrow \text{if } (B) M_4 S_3$	{	$\text{backpatch}(B.\text{truelist}, M_4.\text{instr});$
		$S_2.\text{nextlist} = \text{merge}(B.\text{falseclist}, S_3.\text{nextlist});$ }
$S \rightarrow \{L\}$	{	$S.\text{nextlist} = L.\text{nextlist};$ }
$S_3 \rightarrow A_1;$	{	$S.\text{nextlist} = \text{null};$ }
$M \rightarrow \epsilon$	{	$M.\text{instr} = \text{nextinstr};$ }
$L \rightarrow L_1 M_3 S_1$	{	$\text{backpatch}(L_1.\text{nextlist}, M_3.\text{instr});$
		$L.\text{nextlist} = S_1.\text{nextlist};$ }
$L_1 \rightarrow S_2$	{	$L_1.\text{nextlist} = S_2.\text{nextlist};$ }

En verder . . .

- Dinsdag 4 december: practicum over opdracht 4
- Maandag 10 december: inleveren opdracht 4
- Vrijdag 21 december, 10:00 – 13:00: tentamen
- Tevoren: vragenuur?
