9. Undecidable Problems

9.3. More Decision Problems Involving Turing Machines

**Definition 9.6.** Reducing One Decision Problem to and Reducing One Language to Another Another,

Suppose  $P_1$  and  $P_2$  are decision problems. We say  $P_1$  is reducible to  $P_2$   $(P_1 \le P_2)$ 

- ullet that finds, for an arbitrary instance I of  $P_1$ , an instance F(I)
- the same, or I is yes-instance of  $P_2$ . ullet such that for every I the answers for the two instances are is a yes-instance of  $P_1$  if and only if  ${\cal F}(I)$  is a

(similar for languages)

ω

Two more decision problems:

Accepts: Given a TM T and a string x, is  $x \in L(T)$  ?

 $\mathit{Halts}\colon \mathsf{Given} \ \mathsf{a} \ \mathsf{TM} \ T \ \mathsf{and} \ \mathsf{a} \ \mathsf{string} \ x, \ \mathsf{does} \ T \ \mathsf{halt} \ \mathsf{on} \ \mathsf{input} \ x \ ?$ 

Theorem 9.8 Both Accepts and Halts are undecidable

Instances are ... Accepts: Given a TM T and a string x, is  $x \in L(T)$  ?

Instances are ...  $\it Halts$ : Given a TM  $\it T$  and a string  $\it x$ , does  $\it T$  halt on input  $\it x$  ?

Instances are Self-Accepting: Given a TM T, does T accept the string e(T)?

Now fix a TM T:

 $T ext{-Accepts:}$  Given a string x, does T accept x

Instances are ...

Exercise 11.7. Decidable or undecidable ?

Decision problem: problem for which the answer is 'yes' or 'no':

Given ..., is it true that ...?

Self-Accepting: Given a TM T, does T accept the string e(T)?

**Definition 9.3.** Decidable Problems

If P is a decision problem, and e is a reasonable encoding of instances of P over the alphabet  $\Sigma$ , we say that P is decidable if  $Y(P) = \{e(I) \mid I \text{ is a yes-instance of } P\}$  is a recursive language.

Theorem 9.7.

(statement about languages)

Suppose  $P_1$  and  $P_2$  are decision problems, and  $P_1 \leq P_2$ . If  $P_2$  is decidable, then  $P_1$  is decidable.

4

9 ώ More Decision Problems Involving Turing Machines

cidable. Theorem 9.9. The following five decision problems are unde-

 Accepts-A: Given a TM T, is  $\Lambda \in L(T)$  ?

Proof.

1. Prove that  $Accepts \leq Accepts - \Lambda \dots$ 

Reduction from Accepts to  $Accepts-\Lambda$ .

Instance of Accepts is  $(T_1,x)$  for TM  $T_1$  and string x. Instance of Accepts- $\Lambda$  is TM  $T_2$ .

$$T_2 = F(T_1, x) =$$

$$Write(x) \rightarrow T_1$$

 $T_2$  accepts  $\Lambda_{\rm r}$  if and only if  $T_1$  accepts x

 $A_1 \mbox{ answers 'yes' for } (T_1,x), \mbox{ if and only if } A_2 \mbox{ answers 'yes' for } T_2, \mbox{ if and only } T_2 \mbox{ accepts } \Lambda, \mbox{ if and only if } T_1 \mbox{ accepts } x.$ 

 $A_1$ : Given instance  $(T_1,x)$  of Accepts, 1. construct  $T_2=F(T_1,x)$ ; 2. run  $A_2$  on  $T_2$ .

If we had an algorithm/TM  $A_2$  to solve Accepts-A, then we would also have an algorithm/TM  $A_1$  to solve Accepts, as follows:

10

9

cidable. Theorem 9.9. The following five decision problems are unde-

cidable.

Theorem 9.9.

The following five decision problems are unde-

AcceptsEverything: Given a TM T with input alphabet  $\Sigma$ , is  $L(T) = \Sigma^*$ 

### Proof.

2. Prove that  $Accepts-\Lambda \leq AcceptsEverything$ 

11

12

Proof. 3. Prove that  $AcceptsEverything \leq Subset$ 3. Subset: Given two TMs  $T_1$  and  $T_2$ , is  $L(T_1) \subseteq L(T_2)$  ?

cidable. Theorem 9.9. The following five decision problems are unde-

4. Equivalent: Given two TMs  $T_1$  and  $T_2$ , is  $L(T_1) = L(T_2)$ 

### Proof.

4. Prove that  $Subset \leq Equivalent \dots$ 

cidable. Theorem 9.9. The following five decision problems are unde-

# Given a TM T and a symbol a in the tape alphabet of T, does T ever write a if it starts with an empty tape ?

5. WritesSymbol:

Proof.

5. Prove that  $Accepts-\Lambda \leq WritesSymbol \dots$ 

14

AtLeast10MovesOn- $\Lambda$ : Given a TM T, does T make at least ten moves on input  $\Lambda$  ?

 $\mathit{WritesNonblank}\colon$  Given a TM T, does T ever write a nonblank symbol on input  $\Lambda$  ?

**Theorem 9.10.**The decision problem *WritesNonblank* is decidable

Proof...

16

15

## Definition 9.11. A Language Property of TMs

A property R of Turing machines is called a *language property* if, for every Turing machine T having property R, and every other TM  $T_1$  with  $L(T_1) = L(T)$ ,  $T_1$  also has property R.

A language property of TMs is nontrivial if there is at least one TM that has the property and at least one that doesn't.

In fact, a language property is a property of the languages accepted by  $\mathsf{TMs}.$ 

17

 $\label{theorem 9.12.} \textbf{Rice's Theorem} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision} \\ \textbf{If } R \text{ is a nontrivial language property of TMs, then the decision of TMs, the decision of TMs is a nontrivial language property of TMs, the decision of TMs is a nontrivial language property of TMs, the decision of TMs is a nontrivial language property of TMs is a nontrivial langua$ 

 $P_R$ : Given a TM T, does T have property R ?

is undecidable

Proof..

19

## Rice's theorem cannot be applied (directly)

- ullet if the decision problem does not involve just one TM Equivalent: Given two TMs  $T_1$  and  $T_2$ , is  $L(T_1)=L(T_2)$
- $\bullet$  if the decision problem involves the *operation* of the TM WritesSymbol: Given a TM T and a symbol a in the tape alphabet of T, does T ever write a if it starts with an empty tape ? WritesNonblank: Given a TM T, does T ever write a nonblank symbol on input  $\Lambda$  ?
- if the decision problem involves a trivial property Accepts-NSA: Given a TM T, is L(T) = NSA?

21

**Exercise 9.23.** Show that the property "accepts its own encoding" is not a language property of TMs.

Definition 7.33. An Encoding Function (continued)

For each move 
$$m$$
 of  $T$  of the form  $\delta(p,\sigma)=(q,\tau,D)$  
$$e(m)=1^{n(p)}01^{n(\sigma)}01^{n(q)}01^{n(\tau)}01^{n(D)}0$$

We list the moves of T in some order as  $m_1, m_2, \ldots, m_k$ , and we

$$e(T) = e(m_1)0e(m_2)0...0e(m_k)0$$

18

applied: Examples of decision problems to which Rice's theorem can be

- Accepts-L: Given a TM T, is L(T) = L? (assuming ...)
- 2 1 AcceptsSomething:
- ω Accepts TwoOrMore: ٠->

Given a TM T, is there at least one string in L(T) ?

- Given a TM T, does L(T) have at least two elements AcceptsFinite: Given a TM T, is L(T) finite ?
- 4 0
- AcceptsRecursive: Given a TM T, is L(T) recursive ? (note that  $\ldots$ )

All these problems are undecidable

20
