- 6. Context-Free and Non-Context-Free Languages
- 6.2. Intersections and Complements of CFLs
- 7. Turing Machines

Ν

6.2. Intersections and Complements of CFLs

Excercise.

Show that if L is accepted by a DPDA M, then there is a PDA M' accepting the language $\{x\#y\mid x\in L \text{ and } xy\in L\}$. (The symbol # is assumed not to be in any of the strings of L.)

ω

4

Excercise 5.20.

Show that if L is accepted by a DPDA M, then there is a DPDA M' accepting the language $\{x\#y\mid x\in L \text{ and } xy\in L\}$. (The symbol # is assumed not to be in any of the strings of L.)

Exercise. (from last week)

Let M be a DPDA

Construct a DPDA M^\prime such that $L(M^\prime)=L(M)$ and M^\prime has no Λ -transitions from an accepting state.

Theorem 6.13.

If L_1 is a context-free language and L_2 is a regular language, then $L_1\cap L_2$ is a CFL.

Exercise 6.8.

Show that if L_1 is a DCFL and L_2 is regular, then $L_1\cap L_2$ is a DCFL.

Exercise 6.21. Use Exercises 5.20 and 6.8 to show that the

following languages are not DCFLs. This technique is used in Floyd and Beigel (1994), where the language in Exercise 5.20 is referred to as Double-Duty(L).

a. Pal, the language of palindromes over $\{a,b\}$. (Hint: Consider the regular language corresponding to $a^+b^+a^+\#b^+a^+$.)

b. $\{x \in \{a,b\}^* \mid n_b(x) = n_a(x) \text{ or } n_b(x) = 2n_a(x)\}$

Turing Machines

7.1. A General Model of Computation

9

10

working with a pencil and paper: Assumptions about a human computer

- fixed finite alphabet; The only things written on the paper are symbols from some
- 2. Each step taken by the computer depends only on the symbol he is currently examining and on his "state of mind" at the time;

Ŋ 1

Erasing a symbol or replacing it by another;

Actions of a human computer on a sheet of paper:

Examining an individual symbol on the paper;

symbol

Transferring attention from one symbol to another nearby

3. Although his state of mind may change as a result of his examining different symbols, only a finite number of distinct states of mind are possible.

11

Turing machine

Turing machine has a finite alphabet of symbols. (actually two alphabets...)
Turing machine has a finite number of states.

Turing machine has a tape for reading input, and for writing output (if applicable).

Tape is linear, instead of 2-dimensional.

Tape has a left end and is potentially infinite to the right.

Tape is marked off into squares, each of which can hold one

symbol.

Tape head is centered on one square of the tape for reading and

12

A move of a Turing machine consists of:

- 1. Changing from the current state to another, possibly different
- Replacing the symbol in the current square by another, pos-sibly different symbol;
- Leaving the tape head on the current square, or moving it one square to the right, or moving it one square to the left if it is not already on the leftmost square.

14

Just like FA and PDA, Turing machine

- may be used to accept a language
 has a finite number of states

Unlike FA and PDA, Turing machine

- may also be used to compute a function *
 is not restricted to reading input left-to-right *
- does not have to read all input *
- a function \bullet does not have a set of accepting states, but has two <code>half</code> states: one for acceptance and one for rejection (in case of computing
- may decide not to halt
- $^* =$ just like human computer

7.2. Turing Machines as Language Acceptors

Example 7.3. A TM Accepting a Regular Language

 $L = \{a,b\}^* \{ab\} \{a,b\}^* \cup \{a,b\}^* \{ba\}$

First a finite automaton, then a Turing machine

16

15

Example 7.3. A TM Accepting a Regular Language

 $L = \{a,b\}^* \{ab\} \{a,b\}^* \cup \{a,b\}^* \{ba\}$

First a finite automaton, then a Turing machine

This conversion works in general for FAs. As a result,

only moves to the right,

no modifications of symbols on tape,

no moves to the reject state, but ...

In this case,we could modify TM, so that it does not always read entire input.

17

Example 7.5. A TM Accepting $XX = \{xx \mid x \in \{a,b\}^*\}$

18

Theorem 5.29

If $M=(Q,\Sigma,\Gamma,q_0,Z_0,A,\delta)$ is a pushdown automaton accepting L by empty stack, then there is a context-free grammar G such that L=L(G).

Proof.

Huiswerkopgave 2. Toepassen van stelling 5.29. Inleverdatum dinsdag 27 maart 2012, 13:45 uur

We define $G=(V,\Sigma,S,P)$ as follows: V contains S as well as all possible variables of the form [p,A,q], where $A\in\Gamma$ and $p,q\in Q$.

etc.
